MAGIC WINDOW II

MAKES PAPERWORK PANDEMONIUM VANISH

MAGIC WINDOW II turns your APPLE into a sophisticated word processor. But because MAGIC WINDOW II operates so much like a standard typewriter, it's extremely simple to use. In fact, because of its unique menu structure, it's the easiest to learn, and function selection is virtually error free.

MAGIC WINDOW II's powerful word processing features include automatic formatting, editing, centering, and justification — and these are all done easily "on the video screen" before you ever print. Just type your first draft quickly, then go back and make any needed corrections. You can insert or delete letters or words, even move whole paragraphs with just a few simple keystrokes.

And MAGIC WINDOW II can support 40-, 70-, and 80-column displays, as well as automatically providing 80-column visibility with scrolling. The rule is: What you see on the screen is what you get in print. No word processor on the market has both the features of MAGIC WINDOW II and its simplicity of use.

And as an extra assurance that your document is perfect before printing and mailing, you can use MAGIC WORDS. With incredible speed, MAGIC WORDS proofreads your document for spelling errors and typos, shows you each one in context on the screen, and allows you to correct or ignore each in sequence. Unlike any other spelling checker, it will then automatically create a corrected file as you go so you never need to return to MAGIC WINDOW II to update it yourself manually. Or, if you're busy, MAGIC WORDS will go through your file without waiting for you to act on each error, and provide you with a printout of the errors and their locations so you can correct them at your convenience.

And with a 14,000-word basic dictionary and plenty of memory for you to add technical terms or customer names that you use frequently, MAGIC WORDS becomes a totally personalized program that can catch all your spelling errors and typos.

But now comes the mailing, the really time-consuming part — unless you have MAGIC MAILER. A mailing list merge

system, MAGIC MAILER lets you insert each name and address (or whatever is in your records) into your document quickly and efficiently.

With MAGIC MAILER, you never have to retype a document or an internal address. With just a few keystrokes, each letter becomes an original, and the final phase of the paperwork process is complete — efficiently and to perfection.

Let's face it: The letters, invoices, and other documents you send out represent you to the public. They should be as professional as possible — and they can be. All it takes is a little MAGIC.

Each program is available separately or ask your local software store for Artsci's MAGIC PAK. All three products are included in an attractive library box.

2MHZ 6809 SYSTEMS

GIMIX offers you a variety to choose from!

38 MB WINCHESTER SYSTEM \$17,498.99

HARDWARE FEATURES:

- ★ 2MHz 6809 CPU
- ★ 512KB Static RAM
- ★ 8 RS232C Serial Ports
- ★ 2 Parallel Ports
- ★ DMA Double Density Floppy Disk Controller
- ★ Dual 8" DSDD Floppy Disk System
- ★ Dual Winchester Subsystem with Two 19 MB 5 1/4" Winchester Drives

SOFTWARE FEATURES:

- ★ OS-9 LEVEL TWO Multi-User Operating System
- ★ OS-9 Debugger
- ★ OS-9 Text Editor
- ★ OS-9 Assembler

19 MB WINCHESTER SYSTEM \$8998.09

HARDWARE FEATURES:

- ★ 128K Static Ram
- ★ 2MHz 6809 CPU
- ★ 19 MB 5 1/4" Winchester DMA Subsystem
- ★ 4 RS232C Serial Ports
- ★ 1 MB 5 1/4" Floppy Disk Drive
- ★ DMA Double Density Floppy Disk Controller

SOFTWARE FEATURES:

- ★ OS-9 LEVEL TWO Multi-User Operating System
- ★ OS-9 Text Editor
- ★ OS-9 Debugger
- ★ OS-9 Assembler

128KB MULTI-USER SYSTEM \$6997.39

HARDWARE FEATURES:

- ★ 2MHz 6809 CPU
- ★ DMA Double Density Floppy Disk Controller
- ★ 128KB Static Ram
- ★ 2 RS232C Serial Ports
- ★ Dual 8" DSDD Floppy Disk System

SOFTWARE FEATURES: Your choice of either UniFLEX or OS-9 LEVEL TWO. Both are Unix-like Multi-User/Multi-Tasking Operating Systems.

56KB FLEX / OS-9 "SWITCHING" SYSTEM \$4148.49

HARDWARE FEATURES:

- ★ 2MHz 6809 CPU
- ★ 56K Static Ram
- ★ 2 RS232C Serial Ports
- ★ DMA Double Density Floppy Disk Controller
- ★ 2 Built-in 5 1/4" 40tr DSDD Disk Drives (80 Track DSDD Drive Option . . add \$400.00)

SOFTWARE FEATURES:

- ★ GMXBUG monitor — FLEX Disk Operating System
- ★ OS-9 LEVEL ONE Multi-tasking operating system for up to 56K of memory

WINCHESTER SUBSYSTEMS

Winchester packages are available for upgrading current GIMIX 6809 systems equipped with DMA controllers, at least one floppy disk drive, and running FLEX, OS-9 LEVEL ONE or OS-9 LEVEL TWO. The packages include one or two 19MB (unformatted) Winchester drives, DMA Hard Disk Interface, and the appropriate software drivers. The Interface can handle two 5 1/4" Winchester Drives, providing Automatic Data Error Detection and Correction; up to 22 bit burst error detection and 11 bit burst error correction.

Dual drives can be used together to provide over 30 MBytes of on line storage -- or use one for back-up of the other. (More convenient and reliable than tape backup systems.)

#90 includes one 19MB Drive, Interface, and Software \$4288.90

#91 includes two 19MB Drives, Interface, and Software \$6688.91

Contact GIMIX for systems customized to your needs or for more information.

November Highlights

Games Feature

This month we expand a bit from our usual content and offer an array of games for a wide variety of computers. Although we don't usually publish games, we feel that they may be valuable, particularly where they demonstrate techniques or cultivate a skill in the user. Instead of making games a regular part of MICRO, we prefer to do it all at once!

There are specific games for nearly every computer, including the PET, VIC, Apple, C1P/Superboard, Atari 400/800, and the SYM. In addition, you will find that most can be converted easily to run on even more machines. These represent a variety of types of games too — from action games like "Space Invasion" and "Shootdown," to strategy games like "Number Shuffle," "GOMOKU," and "23 Matches," to "Castle Adventure."

Written in the style of Scott Adams' famous games, "Castle Adventure" (p. 41) tests your memory and analytical skills. You will find yourself in the evil baron's castle in a quest for treasure and the kidnapped princess. "Castle Adventure" was originally written for the PET. We have provided specific line changes to make it run on the Apple. However, except for disk commands, it is written in straight Microsoft BASIC, so owners of OSI, Atari (with Microsoft BASIC), and Color Computer (with extended BASIC) machines should be able to easily adapt "Castle Adventure."

"Solve the Pagoda Puzzle Using Recursive Assembly" (p. 53) is particularly interesting because it demonstrates a technique — having a subroutine call itself — that you may want to apply to your own programs. The author's application is in solving the "Pagoda" or "Tower of Hanoi" puzzle. The program solves the puzzle for a stack of disks of any practical height and outputs a list of specific moves. With a minimum of changes, it will run on any 6502 computer. You may want to try incorporating this routine into a BASIC program that actually shows the disks being moved from peg to peg.

"GOMOKU" (p. 59) is a fast, machine-language version of the oriental game of strategy. It is presented here for VIC, with modifications for PET. "Number Shuffle" is an Atari computer version of "Magic Square," the game where you slide the little numbered squares around until you get them in order. "Space Invasion," for the C1P/Superboard and "Shootdown" are arcade-style action games. Finally, "23 Matches" is a short machine-language game for the SYM. It makes ingenious use of the SYM's LCD display.

This month's editorial (p. 7) offers some thoughts on games and their place in MICRO and in our society.

68000 Coverage Continues

Preliminary results from our survey indicate that a lot of you are interested in the 68000. As part of our continuing effort to keep you informed on this powerful new pro-

cessor, we present two articles this month on the 68000. Dr. Hootman's detailed discussion of the 68000 instruction set continues (p. 27) with the binary arithmetic operations. Handy reference tables are included. Jelemensky and Whiteside (p. 13) conclude their demonstration of 68000 programming techniques.

We haven't seen any games yet for the 68000. Is it because its users haven't gotten over the speed and power? Or is it because these machines aren't finding their way into very many homes?

Atari Coverage Takes Off

With the addition of Contributing Editor Paul Swanson to our staff, MICRO's Atari coverage has improved considerably. Paul's column, a new "From Here to Atari" (p. 103), starts this month. In addition, he continues his character graphics article series with a discussion of fine scrolling (p. 82). This month's data sheet (p. 109 — compiled by Paul Swanson) is a handy reference for serious Atari programmers.

Atari users will be interested in programming extra colors, even in the limited high-resolution modes. Richard and Donna Marmon (p. 96) illustrate two techniques — one that uses adjacent color dots, and one that quickly alternates displays.

Hardware

In keeping with our lighter theme in this issue, the hardware articles we present are simple, single-evening projects. All involve modifications of existing equipment. Ralph Tenny (p. 19) shows how to get a high-quality picture from your color computer using a monitor instead of a TV. A monitor requires a composite video signal, not available on the CC, and the author shows you how to add it. Jim Strasma (p. 35) shows how to take Commodore's cheapest model PET and convert it into a machine with 80-column business capabilities, yet with all the graphic characters still available from the keyboard. OSI owners can now use Atari's inexpensive joysticks with their machines. Joseph Ennis (p. 9) shows how to make the simple changes in your computer board.

Graphics for the Apple

For those interested in improving their game and graphic programming skills, our graphics articles for Atari and Apple will help. Apple programmers will learn about 3-D rotation from Chris Williams (p. 99). If you have done much graphics programming on the Apple, you have probably been annoyed by the unfortunate location of the graphics pages. Authors Berns (p. 93) and Weston (p. 79) present a number of techniques to circumvent this problem.

New Color Computer Column Expands 6809 Coverage

John Steiner's new monthly column "CoCo Bits" covers the 6809-based TRS-80 Color Computer (p. 38). This month he discusses some problems associated with transferring cassette programs to disk and presents a short program to move the game "BEDLAM." Also for the Color Computer owner, Ron Anderson discusses FLEX09 (p. 23) as it is implemented by Frank Hogg Laboratories. FLEX is a universal operating system that opens up a wide range of software for the 6800 and 6809 to the Color Computer owner.

SOFTRONICS

Your host computer won't know the difference!

Softerm provides an *exact* terminal emulation for a wide range of CRT terminals which interface to a variety of host computer systems. Special function keys, sophisticated editing features, even local printer capabilities of the terminals emulated by Softerm are fully supported. Softerm operates with even the most discriminating host computer applications including video editors. And at speeds up to 9600 baud using either a direct connection or any standard communications modem.

Unmatched file transfer capability

Softerm offers file transfer methods flexible enough to match any host computer requirement. These include *character protocol* with user-definable terminator and acknowledge strings, block size, and character echo wait, and the intelligent *Softtrans*™ protocol which provides reliable error-free transmission and reception of data. The character protocol provides maximum flexibility for text file transfers. Any type file may be transferred using the Softtrans protocol which provides automatic binary encoding and decoding, block checking with error recovery, and data compression to enhance line utilization. A FORTRAN 77 source program is supplied with Softerm which is easily adaptable to any host

computer to allow communications with Softerm using the Softtrans protocol.

Softerm file transfer utilizes an easy to use *command language* which allows simple definition of even complex multiple-file transfers with handshaking. Twenty-three high-level commands include *DIAL*, *CATALOG*, *SEND*, *RECEIVE*, *ONERR*, *HANGUP*, *MONITOR* and others which may be executed in immediate command mode interactively or from a file transfer macro command file which has been previously entered and saved on disk.

Built-in utilities

Softerm disk utilities allow DOS commands such as *CATALOG*, *INIT*, *RENAME*, and *DELETE* to be executed allowing convenient file maintenance. Local file transfers allow files to be displayed, printed, or even copied to another file without exiting the Softerm program. Numerous editing options such as tab expansion and space compression are provided to allow easy reformatting of data to accommodate the variations in data formats used by host computers. Softerm supports automatic dialing in both terminal and file transfer modes. Dial utilities allow a *phone book* of frequently used numbers to be defined which are accessed by a user-assignable name and

Online Update Service

The Softronics Online Update Service is provided as an additional support service at no additional cost to Softerm users. Its purpose is to allow fast turnaround of Softerm program fixes for user-reported problems using the *automatic patch facility* included in Softerm as well as a convenient distribution method for additional terminal emulations and I/O drivers which become available. *User correspondence* can be electronically mailed to Softronics, and *user-contributed* keyboard macros, file transfer macros, and host adaptations of the Softtrans FORTRAN 77 program are available on-line.

Most advanced communications software available

Just check Softerm's 300 page user manual. You simply can't buy a more sophisticated package or one that's easier to use. Available now for only \$150 from your local dealer or Softronics, Inc.

SUPER OSI EXPANSION BOARDS

Tired of trying to run your word processor or your DMB on an OSI 64 character video screen? Now there's the SEB-3, THE most versatile 80x24 video board anywhere is available for OSI 48 pin BUSS systems. No longer will you have to consider converting your video-based system to a serial terminal because you've found 64 characters stifling for serious business use. Nor need you give up compatibility with any existing graphics software because the SEB-3 allows you to choose ANY screen format up to 80x24 including 32x32 and 64x32. Since the SEB-3's screen format can be changed at any time under software control, even gaming displays can benefit from screens custom tailored to the game itself. The SEB-3 is so well designed and so versatile that it will not need to be replaced — ever. Simple changes in software and/or hardware will allow the SEB-3 to generate displays up to 256

columns, handle 50 Hz European formats, accommodate custom characters or character cell sizes larger or smaller than 8x8 and transparently access the screen to eliminate screen "glitches". In short, the SEB-3 will meet any demands your system may place on it now and in the future. The SEB-3 also supports an OSI-style floppy disk interface which can handle two 5" or 8" drives. Like all of the boards in the SEB series, the SEB-3 simply "plugs in" to your machine — there are absolutely NO hardware changes. The SEB-3 is designed to replace your outmoded 540 board so you don't even lose a backplane slot. Your keyboard input now also plugs into the SEB-3 — load one of the software drivers and you're ready to go!

SEB-3 Assembled \$259.00
Kit \$220.00

Bare Board \$59.00
Manual only \$5.00

If your Challenger can't generate displays like those shown above **WHAT ARE YOU WAITING FOR?** The SEB-1 High Resolution Graphics and Memory Board (for C1P and Superboard II) and the SEB-2 High Resolution Graphics and Disk Controller Board (for C2/4/8) simply 'plug-in' to your computer and give you instant access to over 49000 individually addressable pixels in up to 8 colors! Your Hi-Res screen can go from 32 x 16 alphanumerics to 256 x 192 point graphics in 11 software selectable modes. The standard video of your computer is left intact, so that none of your current software library is outmoded. Use the graphics for Business, Scientific, Education, or Gaming displays that were impossible — until now!

	SEB-1	SEB-2
Assembled and Tested	\$249.00 (5K RAM)	\$239.00 (1K RAM)
Kit	\$165.00 (No RAM)	\$199.00 (No RAM)

Installation of either board requires absolutely NO modification of your computer—they just 'plug-in'. Nor do they preclude your using any other OSI-compatible hardware or software. In addition to the Hi-Res Graphics the SEB-1 gives C1 & Superboard II users 16K of additional user memory (over and above that memory devoted to the graphics), two 16 bit timers/counters, an on-board RF modulator, and a parallel port with handshaking. The SEB-2 gives OSI 48-pin BUS users an OSI hardware/software compatible Disk controller, and an RF modulator that can be user-populated.

FOR OSI 1P, 2-4P, 2-8P, C4P, C8P

	SEB-1	SEB-2
Bare Board & Manual	\$ 59.00	\$ 59.00
Manual only	\$ 5.00	\$ 5.00

COMING: SEB-3 80x24 Video/Disk Controller (C2/4/8), SEB-4 48K Memory RAM/ROM (C2/4/8), SEB-5 8K RAM/Disk/Sound/Clock/Voice (C1 & Superboard)

About the Cover

Our brave knight, Godfrey de Goodheart, boldly chases dragons through Baron Von Evil's castle in search of the fair Princess Fatima. MICRO features "Castle Adventure" by David Malmberg (page 41). It is written for PET, Apple, and other Microsoft BASIC computers.

The photo, by Kenneth Witham, is of Schloss Anif in Salzburg, Austria. The knight and dragon graphics were drawn on the Apple Graphics Tablet.

MICROTM

Editorial

Responsible Gamesmanship

MICRO does not publish games. We've run editorials explaining why — outlining the weaknesses, drawbacks, and worthlessness of many computer games. The computer was not developed to fill arcades or to force squeals of delight or anguish from mesmerized users who've spent hours killing the same aliens over and over again.

So why have we not only added games in this issue, but FEATURED them? We aren't giving in; we still believe many games are a waste of time. But we also believe that games — when written and presented properly — can educate. In fact, they can act as an effective tool at all educational levels.

For example, there are games that simulate business environments, games that demand logical thought, games that teach us how to program, how to spell, or to calculate mathematical equations. The variations of these games that are most successful actively involve the student/participant in problem solving and decision making. They are not just drills to enable us to push the right button at the right time or to give the right answer; they are lessons in learning — they can expand our understanding of both artificial and human intelligence.

You see, it's the games that just pit one person against the computer in a mindless battle of eye-hand coordination that irritate us the most. (Does an image of your neighborhood's favorite arcade leap to mind?) Maybe these florescent, noisy battlegrounds provide entertainment for those who need to let off a little steam; but to have energetic, lively, questioning children and adolescents glued to machines in meaningless combat for hours on end is scary.

Whose responsibility is it (yours, ours, the schools, the manufacturers) to offer at least enough of the really worthwhile stuff to balance off what's already so, unfortunately, popular?

Judah Schwartz, Professor of Engineering Science and Education at MIT, summed up the software situation in a recent issue of *Classroom Computer News*. Although his comments were directed specifically toward educational material, they can be as easily applied to games in general: "My hope is that the publishers of this country — who control the curriculum far more than they even begin to realize — will stop doing what they are now doing and start to provide materials for computers which are more open-ended, which are more tool-like in nature, which will help children to assume a more active role, which will not trivialize the nature of education, and which will work to make schools more nearly the collaborative community of learners that they should be."

Computers are efficient, friendly, and generally expensive. As with everything else, we want them to be used to their full potential. One way is through well-written, mind-boggling, educational games. So, MICRO would like to promote the use of these types of games. We encourage manufacturers to continue to produce quality products that get the most out of the computer and the participant. We encourage publishers of books and magazines to support the use of stimulating games that require both the use of skill and the growth of skills.

We hope you enjoy the games we present in this issue, but also hope you will learn some new techniques and some good methods for writing your own games. We hope you will give some thought to the social impact of computer games, as well.

- Multiple poke decimal
- Multiple poke hex
- Print w/o word break
- Restore special data
- Speed up Applesoft
- Speed restore
- Store 2-byte values
- Swap variables

For the first time, Amper-Magic makes it easy for people who don't know machine language to use its power! Now you can attach slick, finished machine language routines to your Applesoft programs in seconds! And interface them by name, not by address!

You simply give each routine a name of your choice, perform the append procedure once at about 15 seconds per routine, and the machine language becomes a permanent part of your BASIC program. (Of course, you can remove it if you want to.)

Up to 255 relocatable machine language routines can be attached to a BASIC program and then called by name. We supply some 20 routines on this disk. More can be entered from magazines. And more library disks are in the works.

These routines and more can be attached and accessed easily. For example, to allow the typing of commas and colons in a response (not normally allowed in Applesoft), you just attach the Input Anything routine and put this line in your program:

```
xxx PRINT "PLEASE ENTER THE DATE."; : & INPUT,DATES
```

&-MAGIC makes it Easy to be Fast & Flexible!

Installing Atari Joysticks on the OSI

by Joseph Ennis

A simple, non-destructive modification to the OSI C1P or Superboard is described. This allows the use of inexpensive Atari joysticks. Demonstration software and programming information are also included.

Joystick requires:

C1P
Hardware components
One or two Atari joysticks

Installing Atari joysticks on the OSI 600 board-based computers (Superboard or C1P) is easy. It takes \$9.95 per joystick and five minutes.

Sears is a good source for Atari joysticks; they stock them under two catalog numbers — 6K99835 for a single joystick or T3K7687 for a pair. You'll pay \$19.95 for two. In addition you will need one 12-pin male Molex connector. You may purchase one from your OSI dealer for \$1.00, or from Technical Products Co., Box 12983, University Station, Gainesville, FL 32604 (Molex connectors are \$4.95 for four pair of male and female).

My 600 board came without J4 mounted, but it took me about one minute to push a connector into the holes in the printed wiring board and solder the twelve pins to the board.

When you get the joysticks, cut the Atari cables as close to the connector as possible, and strip enough of each wire to connect to a male Molex connector (about 1/8 inch). I used a drill press vise to hold the Molex connector and an X2 magnifying glass to aid in soldering. I also used the trick of wrapping several turns of number 18 buss wire around the tip of my 15-watt pencil iron to give me a fine soldering point.

Solder the wires of both joysticks (if you plan to use two) to the single male

Molex connector according to the following table:

Molex Pin	Joystick 1	Joystick 2
1	—	Black
2	Black	—
3	—	—
4	—	—
5	Green	Green
6	Blue	Blue
7	Brown	Brown
8	White	White
9	Orange	Orange
10	—	—
11	—	—
12	—	—

For those interested in how this modification works, figure 1 shows the schematic of the 600 board keyboard area with the joysticks connected to connector J4.

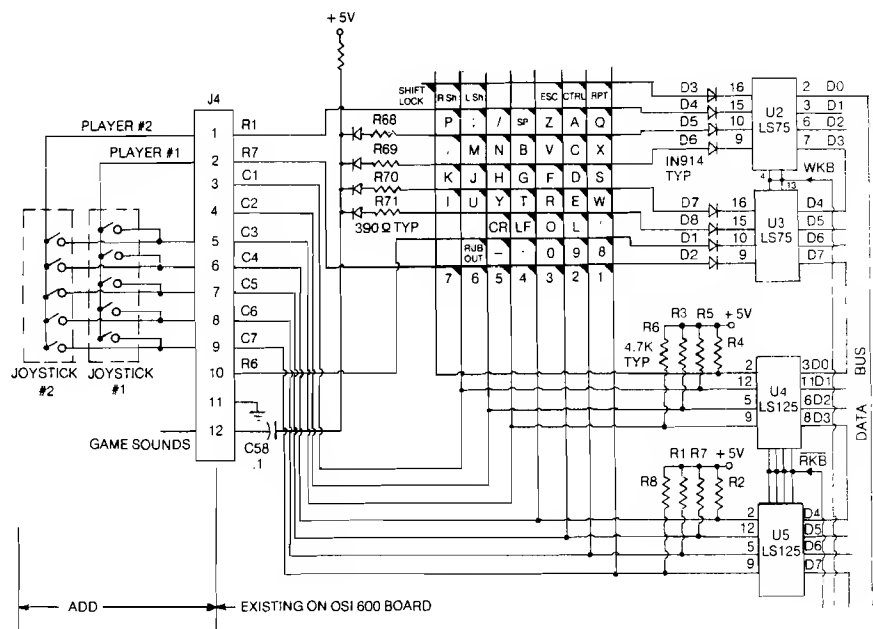

Testing is also easy. First do the usual inspection for poor workmanship, solder bridges, etc. Then plug the

joystick connector into J4, the connector in the lower left corner or closest to the keyboard (see photograph). Plug in the joystick connector so that pin 1, the one with a black wire on it, is toward the back of the 600 board (away from the keyboard). Bring up power and, without touching the joystick, check to see that the keyboard works as before. Now pick up joystick 1, the one with its black wire connected to pin 2. Move the controls on the joystick and note that characters are printed to the monitor screen according to the following table. Pick up joystick 2 and perform the same test. Any problem is most likely a soldering problem.

	Joystick 1	Joystick 2
Fire	Q	1
Up	A	2
Right	Z	3
Down	Space	4
Left	/	5

Don't worry about Up-Right or Up-

Figure 1: Keyboard/Joystick Schematic

Right-While-Firing. These combinations are there, but right now they decode to non-printable symbols and don't show on the monitor screen.

This completes installation and testing. The rest of the joystick operation is software. At the time of this writing OSI had not yet come out with any joystick programs for the 600 board computers, so there had not been any standardization of the joystick move/decode tables. Much joystick software for the OSI is sold by Aardvark Technical Services, 2352 South Commerce, Walled Lake, MI 48088. Aardvark uses a slightly different method of connecting joysticks and a different decode. There are advantages and disadvantages. Aardvark's Mod is longer and requires cutting some traces on the 600 board. However, they have a lot of good software already developed according to their convention. Fortunately, the difference is not great. Joystick 2 in this mod has the same decode as joystick 1 in the Aardvark mod. Therefore, all one-player games need no changes. Aardvark's joystick 2 is connected so that it decodes to: Fire=8 Up=9 Right=0 Down=: and Left=-. For two-player Aardvark games the code must be changed.

When writing software for joysticks, the following line must appear early in the program:

```
POKE 530,1 :REM TURNS OFF KEY-BOARD SCAN, POKE 530,0 WILL TURN KEYBOARD SCAN ON AGAIN
```

Later in the program, when joystick 1 is to be polled, program:

```
POKE 57088,128: P = PEEK(57088)
```

and when joystick 2 is to be polled, program:

```
POKE 57088,2: P = PEEK(57088)
```

Table 1 gives all the possible values for variable P.

A joystick demo program has been included at the end of this article. This demo illustrates most of the techniques for animated graphics and their use with joysticks.

This program, when running, will display two tank symbols. Each tank symbol will be controlled by one joystick. A study of listing 1 will illustrate the programming techniques required by programs using joystick inputs. It is not necessary to have a joystick decode table with all seventeen of the entries given in table 1, since FIRING is merely the position values, less 127. Therefore, note that in line 70 FIRE is set equal to 128 and in line 1000 P is checked to see that it is less than FIRE. If it is, then the program jumps to the FIRE subroutine at 2000. The last

2120 RETURN
```

line in the FIRE subroutine adds 127 back to P, taking out the effect of FIRE before turning control over to the MOVE loop. This halves the time of the loop and the size of the joystick decode table, as only eight values are needed for two joysticks. This still allows the players to move while firing.

There is one disadvantage with the technique used in this joystick mod. When two players are playing and both players are moving their joysticks at the same time, there are combinations where there can be feedback through the joystick switches. With the keyboard polling routine that OSI uses, one data line at a time is set on the LS75 latches, U2 and U3 (see figure 1). When

one latch (these are inverting latches) is set it pulls down the line to one of the rows of keys on the keyboard. If any key in that row is pushed, its position will be read by the LS125 bus drivers. This is why a PEEK to the keyboard address will return the value of 255 (all ones) when no keys are pushed. When only one of the LS75 latch stages is energized, then only one row is set for decode.

Pushing a key in any other row will not produce any output on the data bus. This is why selecting one joystick to row 1 and the other to row 7 will allow one joystick to be decoded independently of the other, even though they are connected to the same columns.

Table 1

Joystick Position	Value of P	Movement Value
Not FIRING and:		Current Position plus
Up	190	-32
Up/Right	158	-31
Right	222	+01
Down/Right	206	+33
Down	238	+32
Down/Left	230	+31
Left	246	-01
Left/Up	182	-33
FIRING and:		
No movement	127	+00
Up	063	-32
Up/Right	031	-31
Right	095	+01
Down/Right	079	+33
Down	111	+32
Down/Left	103	+31
Left	119	-01
Left/Up	055	-33

When the computer wants to check joystick 1 for movement, a 128 is POKEd into the keyboard address (polling must be suppressed at this time by the POKE 530,1 having already been executed) and only a key closure in row 1 will

produce an output on the data bus. It is connected to the only low latch; all the rest are high. As long as 128 has been POKEd to the keyboard address, only a movement of joystick 1 can be read. If joystick 1 is not being moved, then no movement of joystick 2 will produce any output on the data bus. The same thing happens when the computer wants to read joystick 2; a 2 is POKEd to the keyboard address, which allows only the keys in row 7 to be active. No other keys will produce any output on the data bus. The only problem occurs when both joysticks are being moved at the same time. The worse case is when one is moving and firing and the other is only firing. The low set by the latch will feed through the two fire switches and be read as a movement by the bus driver when only a fire was intended. This can really destroy a game. Putting another isolating diode in any of the joystick lines doesn't help, as the LS125's are too sensitive. They see the forward voltage drop of the two diodes in series (one of the diodes D1 through D8 with any additional isolating diode), which causes the LS125 to always stay high. No key closures are detected. A pull-down resistor to a negative supply in conjunction with

the isolating diode would be a solution.

Another solution is a hearing aid battery in series with the joystick's isolating diode. Or you could just give up the option of moving while firing. I use a software solution which, while not perfect, has yet to produce any objectional performance in any of the games I am running. Move the orange wire on joystick 1 from pin 9 to pin 4 and make the following software changes: define a new variable in demo program line 70 like FO=251, and rewrite line 1000 as 1000 IF FIRE < P OR (P AND FO) THEN GOSUB 2000. This way the FIRE push buttons are connected to separate columns and can't feed back through each other's switches. Movements are now only slightly affected. If one joystick is doing Up/Right and the other is doing Up, then both will do Up/Right. But if one is doing Up/Right and the other is doing Up/Left or anything besides pure Up, then both will move their separate ways. In an actual game, this fix is sufficient.

You may contact Mr. Ennis at 212 20 St., Niceville, FL 32578.

The 68000 DREAM MACHINE

WE (SORT OF) LIED:

Motorola has been promoting its advanced microprocessor chip as a vehicle for large, complex systems **exclusively**. Now, the 68000 does work well as the heart of big, complex systems. But their promotional literature implies that one can **only** build big, complex systems with the 68000, and that is dead wrong (in our opinion). Nevertheless, the public (that's you!) perception of the 68000 follows Motorola's line: **Big** systems. **Complex** systems.

Our boards are **not** complex and not necessarily big (starting at 4K). Our newsletter is subtitled "The Journal of Simple 68000 Systems." But since the public has become conditioned to the 68000 as a vehicle for FORTRAN, UNIX, LISP, PASCAL and SMALLTALK people naturally expect all these with our \$595 (starting price) simple attached processor. **Wrong!**

We wrote our last ad to **understate** the software we have available because we wanted to get rid of all those guys who want to run (multi-user, multi-tasking) UNIX on their Apple II and two floppy disks. Running UNIX using two 143K floppies is, well, absurd. The utilities alone require more than 5 megabytes of hard disk.

HERE'S THE TRUTH:

We **do** have some very useful 68000 utility programs. One of these will provide, in conjunction with a suitable BASIC compiler such as PETSPEED (Pet/CBM) or TASC (Apple II), a five to twelve times speedup of your BASIC program. If you have read a serious compiler review, you will have learned that compilers cannot speed up floating point operations (especially transcendental). Our board, and the utility software we provide, **does** speed up those operations.

Add this line in front of an Applesoft program:

```
5 PRINT CHR$(4);"BLOADUTIL4,A$8600":SYS38383
```

That's all it takes to link our board into Applesoft (assuming you have Applesoft loaded into a 16K RAM card). Now run your program as is for faster number-crunching or compile it to add the benefit of faster "interpretation". Operation with the Pet/CBM is similar.

68000 SOURCE CODE:

For Apple II users only, we provide a nearly full disk of **unprotected** 68000 source code. To use it you will have to have DOS toolkit (\$75) and ASSEM68K (\$95), both available from third parties. Here's what you get:

1) 68000 source code for our Microsoft compatible floating point package, including LOG, EXP, SQRT, SIN, COS, TAN, ATN along with the basic four functions. The code is set up to work either linked into BASIC or with our developmental HALGOL language. 85 sectors.

2) 68000 source code for the PROM monitor. 35 sectors.

3) 68000 source code for a very high speed interactive 3-D graphics demo. 115 sectors.

4) 68000 source code for the HALGOL threaded interpreter. Works with the 68000 floating point package. 56 sectors.

5) 6502 source code for the utilities to link into the BASIC floating point routines and utility and debug code to link into the 68000 PROM monitor. 113 sectors.

The above routines almost fill a standard Apple DOS 3.3 floppy. We provide a second disk (very nearly filled) with various utility and demonstration programs.

SWIFTUS MAXIMUS:

Our last advertisement implied that we sold 8MHz boards to hackers and 12.5MHz boards to businesses. That was sort of true because when that ad was written the 12.5MHz 68000 was a very expensive part (list \$332 ea). Motorola has now dropped the price to \$111 and we have adjusted our prices accordingly. So now even hackers can afford a 12.5MHz 68000 board. With, we remind you, **absolutely zero wait states**.

'Swiftus maximus'? Do you know of any other microprocessor based product that can do a 32 bit add in 0.48 microseconds?

AN EDUCATIONAL BOARD?

If you want to learn how to program the 68000 at the assembly language level there is no better way than to have one disk full of demonstration programs and another disk full of machine readable (and user-modifiable) 68000 source code.

Those other 'educational boards' have 4MHz clock signals (even the one promoted as having a 6MHz CPU, honest!) so we'll call them **slow learners**. They do not come with any significant amount of demo or utility software. And they communicate with the host computer via RS 232, 9600 baud max. That's 1K byte/sec. Our board communicates over a parallel port with hardware AND software handshake, at 71K bytes/sec! We'll call those other boards **handicapped learners**.

Our board is definitely not for everyone. But some people find it very, very useful. Which group do you fit into?

An MC68000 Overview, Part 2

by Joe Jelemensky and Tom Whiteside

This second part of the 68000 overview provides simple programming examples to illustrate programming techniques and special features of the MC68000. Part 1 appeared in MICRO (52:32).

A Simple MC68000 Subroutine to Compare Two Strings

As a first example of programming the MC68000, consider the string comparison subroutine in figure 1. This simple subroutine will return with the Zero flag set if the first string matches the second. We will use the convention that all strings must be terminated with a zero. Address registers "A0" and "A1" will be used as pointers to the beginning of the two strings to be compared.

The subroutine documentation shows the calling sequence for STRCMP. In the subroutine usage documentation, the string pointers are initialized using the "MOVEA" (MOVE Address) instructions. The ".L" suffix on the MOVEA instructions tells the assembler that a long address is to be moved. A ".W" suffix specifies a sign extended 16-bit word address. In the MC68000, whenever an instruction has two operands, the first operand is the source and the second is the destination. For the first "MOVEA" instruction, "FIRST" is the absolute memory address to be used as a source for the long word to be moved to the destination "A0". Naturally, we can use any of the other addressing modes to specify the string location instead of absolute if we choose to.

After the string pointers are initialized, the user does a "JSR" (Jump to SubRoutine) to the string compare subroutine followed by a branch based on the Z flag. The "BEQ.S" is a branch if equal to zero (string match). The ".S" suffix tells the assembler that the destination is within the range of an 8-bit signed displacement. An ".L" suffix is used for 16-bit displacements.

The STRCMP subroutine begins and ends with "MOVEM.L" instructions to preserve all the registers that are used. The first "MOVEM" (MOVE Multiple) instruction moves the 32-bit contents of "A0" through "A1" and "D0" to the stack, which is pointed at by "A7". The assembler syntax for the register list on a "MOVEM" instruction can be in the form "A0/A1/A2/A3/A4/A5/A6/A7/D0/D1/D2/D3/D4/D5/D6/D7" or the shortened form "A0-A7/D0-D7". The "-{A7}" des-

tinuation means to use the pre-decrement indirect addressing mode with the stack pointer "A7". This is equivalent to pushing the registers onto the system stack. The MC68000 assembler automatically adjusts the number to decrement or increment based on the total size of the operation. The final "MOVEM" instruction does just the opposite and loads "A0" through "A1" and "D0" from the stack using the post-increment indirect addressing mode from "A7". This is

Figure 1: MC68000 String Compare

ROUTINE:	STRCMP --- String CoMPare		
PURPOSE:	Compare two strings. If the first string matches the second string then return with the "Z" bit set. The user points A0 at the start of the first string, and A1 at the start of the second.		
ASSUMPTIONS:	Strings terminate in a zero.		
	sample string:	FCC 'this is a string' FCB 00	
EXAMPLES:	First string	Second string	Z bit
	'cattle'	'cattle'	1 match
	'cat'	'cattle'	1 match
	''	'any string'	1 match
	'cattle'	'cat'	0 no match
	'cat'	'fatcat'	0 no match
USAGE:	MOVEA.L FIRST,A0 POINT AT FIRST STRING MOVEA.L SECOND,A1 POINT AT SECOND STRING JSR STRCMP COMPARE THE STRINGS BEQ.S xxxx BRANCH IF MATCH IS FOUND		
STRCMP EQU *			
*	MOVEM.L A0-A1/D0, -(A7) PRESERVE ALL REGISTERS ON THE STACK		
*			
LOOP	EQU *		
	MOVE.B (A0),D0	GET THE NEXT CHARACTER IN THE	
	BEQ.S QUIT	FIRST STRING. IF AT THE END OF THE	
		FIRST THEN IT MATCHES!	
*			
	CMP.B D0,(A1) +	DOES NEXT CHARACTER IN THE	
	BEQ.S LOOP	SECOND MATCH? IF IT MATCHES KEEP	
		TRYING. OTHERWISE, FALL THROUGH	
		WITH Z BIT = 0.	
*			
QUIT	EQU *		
	MOVEM.L (A7) +,A0-A1/D0	RESTORE THE REGISTERS	
	RTS	AND LEAVE.	

equivalent to pulling the registers off the system stack.

The actual string compare code is only four instructions long. The "MOVE.B" instruction moves the next character from the first string to "D0" and bumps the first string pointer to the next character. If we have reached the end of the first string then, by our convention that all strings end in zero, the Zero flag will be set and the short branch will be taken. (We found a match!) Otherwise, the "CMP.B" instruction checks to see if the lower byte in the data register matches the next character in the second string and bumps the pointer to the next character. If the characters match, the routine loops back to "LOOP" and tries the next character. If they do not match (including the case where we reach the end of the second string) the code falls through with the Zero flag cleared.

MC68000 Code for a Pascal Loop

The next example illustrates use of the MC68000's powerful DBcc looping instruction. DBcc is designed to speed up the "FOR", "WHILE", and "REPEAT UNTIL" loops used so frequently in high-level languages [HLL]. The DBcc instruction has three parameters: a terminating condition, a data register, and a branch displacement. The instruction first sees if the terminating condition has been met, and if so, the branch specified by the branch offset is not taken. If the terminating condition is not met, the specified data register is decremented. If the result of this decrement is not -1 then the branch is taken. Otherwise, the branch falls through. The "cc" part of the instruction can be any of the conditions shown in table 6 [see Part 1, MICRO 52:38].

The following Pascal procedure and accompanying MC68000 code fragment illustrate how the DBcc instruction works (figure 2). The "REPEAT UNTIL" loop will continue until "i" has counted down to -1 or "CAT" equals "RAT". The MC68000 code uses "D0" for "i" and uses "DBEQ" to loop until "D0" = -1 or the previous comparison sets the Z flag. The DBcc instruction takes no more time than a simple branch instruction when the branch is taken. The equivalent code without the DBcc instruction is obviously much longer.

High-Level Language Procedure Calls

It is becoming increasingly important for processors to be able to handle subroutines efficiently as programs become more modular. This is true both

Figure 2: Example use of the DBcc (test condition Decrement and Branch) instruction.

      RTS

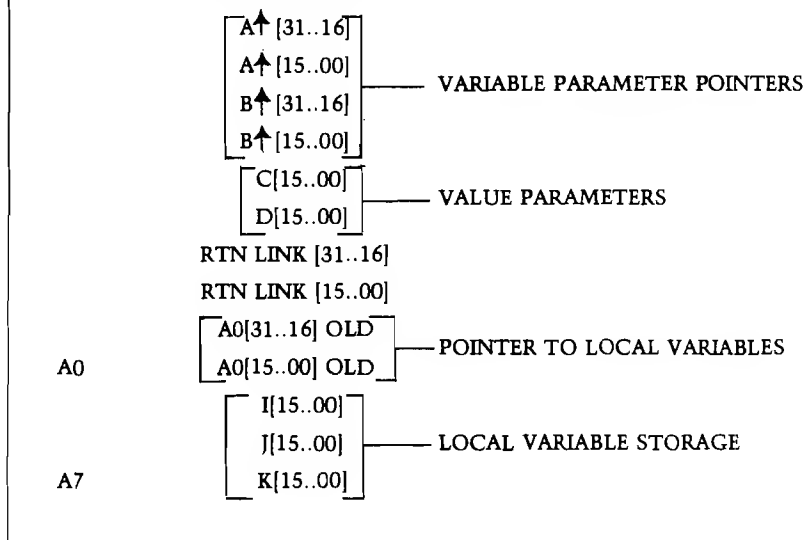

```

at the assembly-language level and for implementing modern HLLs. Figure 3 shows a typical Pascal procedure and how the procedure call might be implemented in MC68000 code.

Procedure "dojunk" is a typical Pascal procedure with variable parameters "a" and "b" and value parameters "c" and "d". For those unfamiliar with Pascal, a value parameter is a copy of a variable passed to a procedure. This copy can be modified by the procedure but the changes are not passed back to the calling procedure when the procedure exits. Variable parameters, unlike value parameters are passed back to the calling procedure as pointers to the variables. Value parameters are copies of the variables. The MC68000 code for calling procedure dojunk begins by initializing the stack with the procedure parameters. The two "PEA" instructions push the pointers to variables "A" and "B". The two "MOVE" instructions push copies of variables "C" and "D" on the stack. The procedure is then called with the JSR instruction. When the procedure returns to the calling routine, the space made on the stack for the parameters is removed with the ADDQ instruction.

When procedure dojunk (figure 4) is

Figure 4: Stack Usage for Pascal Procedure Call Example

called, the LINK instruction provides a clean way to make room for local variables ("i", "j", "k"). The LINK instruction pushes the old value of "A0" on the stack, sets "A0" equal to the stack pointer, and subtracts the offset (in this case three words) from the stack pointer. With this technique,

local variables are referenced with negative offsets off "A0" and parameters are referenced with positive offsets. This technique of using the stack supports re-entrant code and recursion with no problems. Before dojunk exits, it uses UNLK to clear off the local variable space it used.

SeaFORTH for the Apple computer

Is a consistent structured operating system providing the advanced programmer with the tool to easily develop programs from machine language to high level compiled applications. With SeaFORTH, the edit-compile-execute-edit cycle is measured in seconds, not minutes.

The integrated SeaFORTH package includes:

- Editor
- Disc I/O
- Assembler
- Hi-res Graphics
- Transcendental Floating Point
- Command Line Input with Editing
- Detailed 150 Page Technical Manual with Complete Source Listing!

Implemented as a true incremental compiler, SeaFORTH generates machine code, not interpreted address lists. SeaFORTH's direct-threaded-subroutine implementation executes faster than interpreted address-list versions.

Apple SeaFORTH requires a 48K Apple II+, with DOS 3.3. Manual and copyable disk are available for only \$100.00

Compatible SeaFORTH for the AIM requires a terminal and is only available in EPROMs. Manual and EPROMs \$150.00

Manuals available, separately, for only \$30.00

All prices include UPS shipping.

VISA or MASTER CHARGE welcome.

Range Checking Using the MC68000

The MC68000 "CHK" instruction provides an efficient mechanism to insure that array bounds are not exceeded in high-level language implementations. As an example of range checking with CHK, consider the problem of enforcing array boundary checking in a simple Pascal program. Figure 5 shows the stack usage for a simple variable declaration using the same scheme described in the "Procedure Call" example. The individual elements of the array "data" will be accessed by indexing off the pointer "A0". The range checking's duty is to insure that we do not attempt to access an element of "data" before its true beginning or after element "MAX". The consequences of exceeding the array bounds range from inadvertently modifying another variable (such as "i", "j", or "misc") to stepping on a subroutine return link! Figure 6 shows a simple Pascal statement to clear the "ith" element of "data" and the MC68000 code to accomplish it with the necessary range check. The code assumes that register "D0" contains the current state of "i". The CHK instruction examines the lower word in the specified register ("D0") and generates an error trap if it is less than 0 or greater than "MAX". Otherwise, the code falls through to the MOVE instruction that clears the "ith" element of "data".

Conclusion

We hope this article has given you some insight into the extensive power of the MC68000. The 16-bit data bus, the 16 megabytes of directly addressable memory, the sixteen 32-bit user-accessible registers, the powerful instruction set, numerous addressing modes, and fast execution speed are enough to really get folks excited.

Future Growth

The MC68000 is not the only member of this powerful microprocessor family. Motorola is taking advantage of its modular, microprogrammed structure to develop other processors which are upward and downward compatible to the MC68000.

The MC68008 is a machine and assembly level-compatible version of the MC68000 with an 8-bit data and 20-bit address bus for low-cost systems that need the performance of the MC68000 and can tolerate a slight decrease in throughput for reduced system costs.

With the MC68010, Motorola adds virtual machine capabilities to the

Figure 5: Array Storage on the Stack for the Range Checking Example

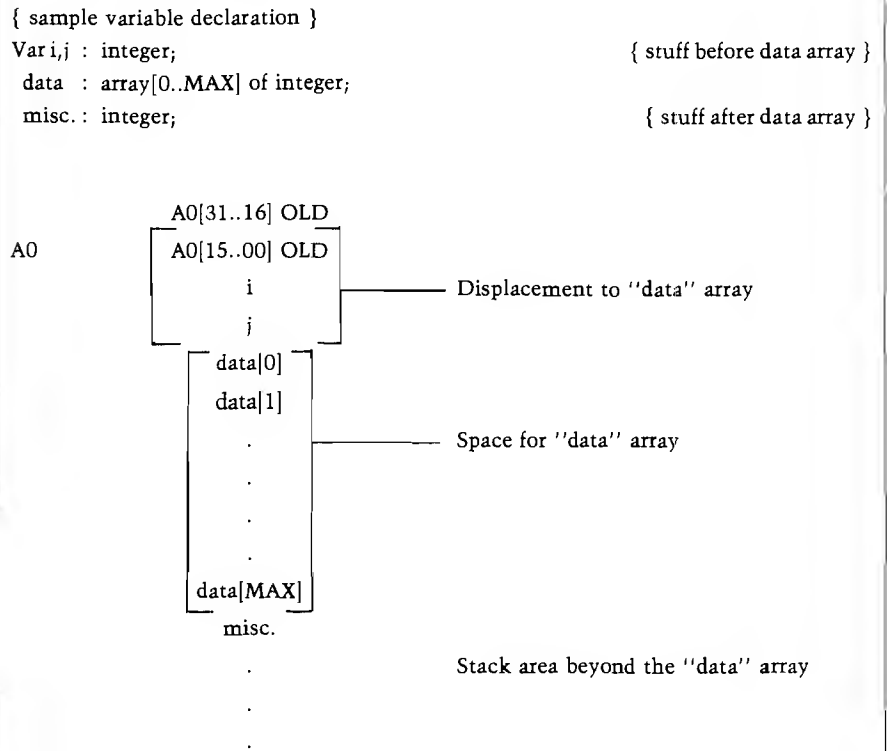

Figure 6: Example of Range Checking Using the MC68000

```

MC68000 architecture.

A full 32-bit implementation (32-bit address and data buses) of the architecture with an enhanced instruction set and on-board cache is in design. The part will be designated the MC68020 and will contain all of the additional features of the MC68010.

A full complement of peripherals for the MC68000 family have been introduced or are in development. These include a Direct Memory Access controller (MC68440), a Memory Management Unit (MC68451), a Floating Point Arithmetic Co-processor (MC68881),

and several data communication parts.

Because of this commitment to the continuation and enhancement of the MC68000 family, systems and software for the MC68000 are insured a long useful life.

MICRO

FOUR TO GROW

Four software packages, that is, to make your Apple® computer really grow! Versatility is the key to computing success, and with Advanced Operating Systems, it's as easy as one, two, three.

APPLE-AIDS is a collection of 12 Applesoft and machine language programs designed to bring you greater flexibility and control over your microcomputer.

In addition to several programs which allow you to examine and change various track/sector contents, format new disks, and create and edit EXEC files, APPLE-AIDS includes two programs you can't afford to be without. UNDELETE FILES allows you to recover accidentally deleted files which you thought were lost forever. KILL DOS removes DOS from any disk freeing up more space for your programs or data.

Russ Adams, a reviewer for INFO-WORLD, writes, "Its (APPLE-AIDS) documentation is the finest I have seen since joining the INFOWORLD Software Review Board." Ease of use and extensive documentation make APPLE-AIDS a valuable addition to every Apple software library. #26066, \$49.95

HELLO CENTRAL! changes your Apple II® or Apple II Plus® into a highly versatile communications center.

Establish direct communications with other computers of any make or tap into the wealth of information available from the hundreds of public-base services like THE SOURCE.

HELLO CENTRAL!'s most unique feature is its text buffer. Messages or entire files can be uploaded and downloaded into the text buffer which holds up to 18,000 characters. The buffer text can be scanned, changed, and then saved to disk.

The best thing about HELLO CENTRAL! is that you don't have to be a professional to get professional results. A few simple keystrokes will accomplish any of your text/communications tasks. #26081, \$99.00

MUSIC GAMES skillfully combines the sound and high resolution graphics of the popular Apple computer to provide both visual and audible reinforcement to the study of music. Twelve different programs, selected from a menu, cover ear training, note recognition and writing, rhythm practice, and listening enjoyment. These versatile games are written for ages 5 through adults. #26116, \$39.95

PEN PAL gives you the power and versatility of higher-priced word processors in an easy-to-use format. With only 29 commands, you can quickly and easily create lengthy reports or short memos. PEN PAL gives you 40- and 80- column screening, joystick control of the cursor for quick editing, complete printer control, plus both upper and lower case capabilities. PEN PAL is the affordable solution to your word processing needs. #25115, \$59.95

Advanced Operating Systems has four good ways to make you and your Apple grow and grow!

Now available at your local software retailer, or call 1-800-428-3696 to order. (Indiana residents, call (317) 298-5566.) MasterCard and VISA accepted.

AARDVARK — THE ADVENTURE PLACE

ADVENTURES FOR OSI, TRS-80, TRS-80 COLOR, SINCLAIR, PET, VIC-20

ADVENTURES — Adventures are a unique form of computer game. They let you spend 30 to 70 hours exploring and conquering a world you have never seen before. There is little or no luck in Adventuring. The rewards are for creative thinking, courage, and wise gambling — not fast reflexes.

In Adventuring, the computer speaks and listens to plain English. No prior knowledge of computers, special controls, or games is required so everyone enjoys them—even people who do not like computers.

Except for Quest, itself unique among Adventure games, Adventures are non-graphic. Adventures are more like a novel than a comic book or arcade game. It is like reading a particular exciting book where you are the main character.

All of the Adventures in this ad are in Basic. They are full featured, fully plotted adventures that will take a minimum of thirty hours (in several sittings) to play.

Adventuring requires 16k on Sinclair, TRS-80, and TRS-80 Color. They require 8k on OSI and 13k on VIC-20. Sinclair requires extended BASIC.

TREK ADVENTURE by Bob Retelle — This one takes place aboard a familiar starship and is a must for trekkies. The problem is a familiar one — The ship is in a "decaying orbit" (the Captain never could learn to park!) and the engines are out (You would think that in all those years, they would have learned to build some that didn't die once a week). Your options are to start the engine, save the ship, get off the ship, or die. Good Luck.

Authors note to players — I wrote this one with a concordance in hand. It is very accurate — and a lot of fun. It was nice to wander around the ship instead of watching it on T.V.

CIRCLE WORLD by Bob Anderson — The Alien culture has built a huge world in the shape of a ring circling their sun. They left behind some strange creatures and a lot of advanced technology. Unfortunately, the world is headed for destruction and it is your job to save it before it plunges into the sun!

Editors note to players — In keeping with the large scale of Circle World, the author wrote a very large adventure. It has a lot of rooms and a lot of objects in them. It is a very convoluted, very complex adventure. One of our largest. Not available on OSI.

HAUNTED HOUSE by Bob Anderson — This one is for the kids. The house has ghosts, goblins, vampires and treasures — and problems designed for the 8 to 13 year old. This is a real adventure and does require some thinking and problem solving — but only for kids.

Authors note to players — This one was fun to write. The vocabulary and characters were designed for younger players and lots of things happen when they give the computer commands. This one teaches logical thought, mapping skills, and creativity while keeping their interest.

DERELICT by Rodger Olsen and Bob Anderson — For Wealth and Glory, you have to ransom a thousand year old space ship. You'll have to learn to speak their language and operate the machinery they left behind. The hardest problem of all is to live through it.

Authors note to players — This adventure is the new winner in the "Toughest Adventure at Aardvark Sweepstakes". Our most difficult problem in writing the adventure was to keep it logical and realistic. There are no irrational traps and sudden senseless deaths in Derelict. This ship was designed to be perfectly safe for its' builders. It just happens to be deadly to alien invaders like you.

PYRAMID by Rodger Olsen — This is one of our toughest Adventures. Average time through the Pyramid is 50 to 70 hours. The old boys who built this Pyramid did not mean for it to be ransacked by people like you.

Authors note to players — This is a very entertaining and very tough adventure. I left clues everywhere but came up with some ingenious problems. This one has captivated people so much that I get calls daily from as far away as New Zealand and France from bleary eyed people who are stuck in the Pyramid and desperate for more clues.

QUEST by Bob Retelle and Rodger Olsen — THIS IS DIFFERENT FROM ALL THE OTHER GAMES OF ADVENTURE!!!! It is played on a computer generated map of Alesia. You lead a small band of adventurers on a mission to conquer the Citadel of Moorlock. You have to build an army and then arm and feed them by combat, bargaining, exploration of ruins and temples, and outright banditry. The game takes 2 to 5 hours to play and is different each time. The TRS-80 Color version has nice visual effects and sound. Not available on OSI. This is the most popular game we have ever published.

MARS by Rodger Olsen — Your ship crashed on the Red Planet and you have to get home. You will have to explore a Martian city, repair your ship and deal with possibly hostile aliens to get home again.

Authors note to players — This is highly recommended as a first adventure. It is in no way simple—playing time normally runs from 30 to 50 hours — but it is constructed in a more "open" manner to let you try out adventuring and get used to the game before you hit the really tough problems.

NUCLEAR SUB by Bob Retelle — You start at the bottom of the ocean in a wrecked Nuclear Sub. There is literally no way to go but up. Save the ship, raise her, or get out of her before she blows or start WWII.

Editors note to players — This was actually plotted by Rodger Olsen, Bob Retelle, and someone you don't know — Three of the nastiest minds in adventure writing. It is devious, wicked, and kills you often. The TRS-80 Color version has nice sound and special effects.

EARTHQUAKE by Bob Anderson and Rodger Olsen — A second kids adventure. You are trapped in a shopping center during an earthquake. There is a way out, but you need help. To save yourself, you have to be a hero and save others first.

Authors note to players — This one feels good. Not only is it designed for the younger set (see note on Haunted House), but it also plays nicely. Instead of killing, you have to save lives to win this one. The player must help others first if he/she is to survive — I like that.

ADVENTURE WRITING/DEATHSHIP by Rodger Olsen — This is a data sheet showing how we do it. It is about 14 pages of detailed instructions how to write your own adventures. It contains the entire text of Deathship. Data sheet — \$3.95. NOTE: Owners of OSI, TRS-80, TRS-80 Color, and Vic 20 computers can also get Deathship on tape for an additional \$5.00.

PRICE AND AVAILABILITY:

All adventures are \$14.95 on tape except Earthquake and Haunted House which are \$9.95. Disk versions are available on OSI and TRS-80 Color for \$2.00 additional.

Please specify system on all orders

ALSO FROM AARDVARK — This is only a partial list of what we carry. We have a lot of other games (particularly for the TRS-80 Color and OSI), business programs, blank tapes and disks and hardware. Send \$1.00 for our complete catalog.

VIC-20

A Monitor for the Color Computer

by Ralph Tenny

This article provides step-by-step instructions to get composite video from the video section of the Color Computer. You will use this signal to drive a standard video monitor instead of a color or black-and-white TV set.

Required:

TRS-80 Color Computer
A monitor-quality CRT

The Radio Shack Color Computer, an excellent low-cost computer, uses a color TV set as the intended display device. Unfortunately, TV sets have relatively low resolution, which limits the clarity of the display. The use of a TV set can be either good or bad, depending on whether color graphics are used in your program. Since I use it as a text processing system, I need a video terminal with maximum display clarity. Even the relatively low character density of the Color Computer's video output isn't very clear on the average TV set — either color or B&W. The signal itself is of high technical quality, and a higher-resolution display can make a great improvement in the readability of the display. If a B&W monitor is substituted for the TV set, this goal is achieved. As you can see from photo 1, my video monitor (which is not a super-high resolution unit) gives an excellent display capability when used with the Color Computer.

Since the remainder of the article describes a process of modifying the Color Computer, you should realize that any internal modifications will probably void the warranty. If the computer is more than three months old, the warranty will have expired. If you modify the computer and it needs repair, you may have to remove the modification before Radio Shack will repair it. I have not had any problems in

over a year, and I still feel comfortable with my decision.

The Color Computer's video output is a complete TV signal and is generated by a very low-power TV transmitter mounted within the Color Computer. Part of the display problem is the fact that the TV tuner is deliberately

limited, therefore the signal must also be limited. Even if the tuner is bypassed, the TV's display resolution is reduced as a cost-saving measure, since high resolution is not required for normal TV viewing.

The Color Computer uses an MC6847 Video Display Generator to produce all the signals required to drive a TV set; these include composite sync, blanking, video luminance, and color information. The basic approach is to use a buffer amplifier to process the output of the MC6847, enabling the signal to be fed directly to a video monitor. Figure 1 shows the schematic of this buffer amplifier; it was patterned after circuitry suggested by Motorola, the manufacturer of the 6847. This amplifier was built on thin, two-sided, copper-clad board with one side etched into small pads. Figure 2 is a full-size layout of the amplifier board, and figure 3 shows the parts layout.

Access to the Color Computer is easy and requires only that you take out seven screws to remove the top. Note that one screw is located beneath a factory seal. If you remove this screw

```
10  NAM TAPTST
15  OPT S0
20  ORG $7000

25 + THIS PROGRAM WRITES A PATTERN TO CASSETTE TAPE, THEN WILL DECODE THE PATTERN
30 + CHECKING FOR TAPE ERRORS AND STOPPING ON ERRORS.
35 + THE WRITE FUNCTION IS AN ENDLESS LOOP, AND MUST BE STOPPED USING RESET.
```

Photo 1: A close-up look at a Color Computer display on a video monitor. Note that each pixel is a sharply-defined square.

Figure 1: Schematic for the video buffer amplifier, which mounts internal to the computer. It amplifies the video output of the 6847 and turns it into a low-impedance signal suitable for driving a cable to the external monitor.

Photo 2: Interior view of the area where the amplifier will be mounted. The long IC is the MC6847, which will be covered by the buffer amplifier as shown in photo 3.

Photo 3: A view of the buffer amplifier mounted, with the output cable attached.

Figure 2: Full-size layout of the amplifier board. Make the board by etching the lines shown to divide the board into eight segments as shown.

you will deface the seal, which voids your warranty.

Once you loosen the screws, put a piece of tape over each hole so the screws will not fall out when you turn the computer upright. With the screws loosened, the top will lift off, leaving the keyboard resting on standoffs and revealing the inner RF shield.

Note that the top of the shield is a friction fit to the shield sides via numerous spring-loaded fingers. Work the shield top off by lifting it a little bit all around; keep lifting until it lifts straight off. Once you can see inside, find the MC6847 and MC1372 ICs as shown in photo 2. Also, in photo 2, you will note a solid ground wire curving up over the 6847, plus a heavy wire coming from one side of C26 and smaller wire coming off the circuit board between C42 and the 1372. The solid wire is circuit common, the large wire is +5 volts, and the small wire is the signal input to the buffer board. Photo 3 shows the video buffer installed, resting on the 6847. The large wire has been soldered to the +5 volt input of the buffer board, the ground wire to the amplifier common, and the small wire to the amplifier input. A small 183-ohm cable has its shield soldered to the amplifier common and the center conductor to the amplifier output. The other end of the 183-ohm cable runs across to the corner of the RF shield (the top left corner of the shield as seen from the front of the computer).

Parts List for Video Buffer Amplifier Circuit

C3	68 pF dipped mylar capacitor
R1	33K ohm, 1/4-watt resistor
R2	62K ohm, 1/4-watt carbon resistor
R3	5.1K ohm, 1/4-watt carbon resistor
R4, R5, R6	51 ohm, 1/4-watt carbon resistor
Q1, Q2	2N2222 NPN transistors

Photo 4: Oscilloscope trace of the output video showing one video frame.

Photo 5: An oscilloscope trace of three lines of horizontal video.

Figure 3: Parts layout for the amplifier board. Each part is soldered into place in the approximate location sketched.

Once the amplifier is in place, turn on the computer and check the video output from the cable. Photo 4 shows one vertical frame of video, and photo 5 shows three horizontal lines of video. If your amplifier does not have similar output, double-check the circuit and adjust C2 until the response is correct.

After testing the amplifier, send its output into a video monitor and make whatever level adjustments are needed

to obtain a good picture. Once the monitor is working, re-install the computer cover and enjoy your computer's new display.

You may contact the author at P.O. Box 545, Richardson, Texas 75080.

FOR COMPLETE GRAPHICS: VersaWriter

EDUCATION

ARTIST

GAME PROGRAMMER

HOBBIST

ENGINEERING

CHILDREN

Whether you are a teacher, an artist, an engineer, a programmer, or a hobbyist with little or no programming experience, the VersaWriter is the answer to your graphics need. With the VersaWriter exploring the world of micro computer graphics is as easy as tracing. The VersaWriter

doesn't just trace a picture though. With simple one key commands you can add color and text to your pictures, move objects across the screen, make scale drawings and even draw with different size brushes. The VersaWriter is as limitless as your imagination.

For complete graphics on your Apple II/II+, or IBM PC, the Versa Writer from Versa Computing, Inc. is your answer. Complete hardware/software system ready for use - \$299.

FLEX and the TRS-80 Color Computer

by Ronald W. Anderson

Here is a brief description of the FLEX09 operating system as implemented on the TRS-80 Color Computer.

The configuration described here is available from Frank Hogg Laboratories [130 Midtown Plaza, Syracuse, NY 13210] with 64K or RAM installed (\$1275), as well as an assortment of disk drive packages. If you already have a TRS-80, then Frank Hogg Laboratories sells the operating system and modification instructions separately [\$99]. While it is possible to run the FLEX operating system with one disk drive, two are recommended. You may choose from a minimum package of one single-sided, double-density, 35-track drive, or up to three double-sided, double-density, 40-track drives. The latter will hold up to 375K of data on each drive. You may also use one of the 80-track, double-density drives and have over 700K bytes on one disk, although the 80-track version is not compatible with Radio Shack's disk operating system.

FLEX is the standard operating system for 6800 and 6809 systems. FLEX is so universal that there are versions that will run on the Motorola Exorciser. FLEX is a "Unix-like" operating system and has a nice set of calls that do all the work to interface your assembler program to the disk drivers. There are literally 100 utility programs available for FLEX.

The manual that comes with the operating system is basically the FLEX operating system manual with additional pages that apply to the Color Computer. There is a well-written section on getting your system up and running. First you configure the software to match your hardware. The system boots up expecting 35-track, single-sided drives. To access more tracks or double-sided drives, you must run a utility program that will tell the

system you have 40 tracks and double-sided drives, for example. Your drives need not all be alike. You may specify drive 0 as being single-sided and having 35 tracks, and drive 1 as being double-sided and having 40 tracks. Although this might seem like a nuisance, you only need to run the utility program once. This generates a command file that is appended to FLEX containing information on your drives, the terminal, and drivers for your printer.

I did a bit of experimenting with the SETUP command that does all the configuring, and discovered I could specify "reverse video," which is really "normal video" to anyone who has worked in front of a terminal for any time. I find a blinking cursor to be distracting, so I made it a plain block cursor. Now my system will power up just the way I want it.

Another feature is the keyboard's ability to provide all the ASCII codes. The control codes, such as Control C, are generated by holding the shift and up arrow simultaneously (equivalent of the control key on a terminal), and then pressing the desired key, C for example. If you ever program in Pascal and/or "C", you will need several characters that are not included on the Color Computer keyboard.

Without going into detail, I will give an example of the key assignments and how to access them. You may remember that upper case (SHIFT) 8 is a left parenthesis "{", and SHIFT 9 is a right parenthesis "}". Use the CONTROL combination (SHIFT ^) and type 8 and you get a left square bracket "[". SHIFT ^ 9 and you get a right square bracket "]". "C" requires the use of curly braces. SHIFT ^ BREAK 8 will cause a left brace "{" to be generated, and the same combination for a 9 will generate a right curly brace "}". The control and shift keys are depressed first, and are all held simultaneously before keying the 8 or

9. Holding three keys down and typing a fourth is not easy, but it's better than not being able to generate the code for those characters.

Sometimes disk drives run slightly fast, or irregularly, and squeezing the sectors close enough to get 18 on a track results in unreliable disk access. There is a NEWDISK utility that will automatically reduce the number of sectors to 17 if it encounters problems. Another NEWDISKA utility will put 18 sectors on closer together. I have had no trouble using NEWDISKA. A sector in the FLEX system is 256 bytes long, but four bytes are used for system purposes, so a sector actually holds 252 bytes of data. A single-sided, 35-track disk will hold 612 sectors (using NEWDISKA). If your drive has 40-track capability, you will get 702. A double-sided 40-track will result in 1404. If these numbers don't seem to add up correctly, it is because FLEX uses the first track (track 0) for a loader, disk system information record, and file directory sectors. Also, FLEX requires that track 0 always be single density. Therefore, the tracks actually available to the user are one less than the total number on the disk.

Once FLEX is running, make another copy of the system disk. Use NEWDISK or NEWDISKA to format a blank disk, and then use a utility called PUTBOOT.LDR to install the loader on the disk. The loader is readable by the Color Computer disk operating system. It loads a short program that loads and executes a longer loader program that loads all of the FLEX operating system. It sounds complicated but only takes a few seconds to execute. You *must* put the boot loader on your disk first. If you have copied any files onto the newly formatted disk, there is a chance that the system may have allocated you space where the boot loader needs to be. PUTBOOT will inform you that you can only in-

DEALER INQUIRIES INVITED

stall the loader on a newly formatted disk, and quit.

After installing the loader, you may copy everything from the system disk to your new system disk *except the loader installation utility PUTBOOT.LDR*. An attempt to copy it will get you a DISK SPACE FULL error and a lot of garbage on your disk. If you try to GET PUTBOOT.LDR (for those of you not familiar with FLEX, GET is a utility that reads a disk file to memory but doesn't execute it), you will find that it tries to execute, finds that you haven't specified a drive number, and erases itself from memory before returning to FLEX. Unless you enjoy "puzzles" and are quite familiar with FLEX and the format of binary files, you will have to use your master disk to make all further system disks.

Having copied all the supplied files to your system disk, you must run one further utility, called LINK. LINK will tell the boot loader just where on the disk the file FLEX.SYS is located. My advice is to make two system disks, and hide the master and one of them in a safe place where they won't get hot, bent, or damaged by a magnet. When you wipe out your working system disk you can get the backup and generate another backup for the safe storage area.

The video display looks like a terminal. Most terminals accept control codes to do such things as clear the screen, position the cursor for the next letter to be output, etc. A set of such codes has been provided. You can control the display without getting into the assembler-level CRT driver code. That will make it easier for software suppliers to write compatible software for the Color Computer.

The Color Computer format is 16 lines of 32 characters each, and the character generator displays lower case in reverse video, which is barely usable. Software will soon be available to allow use of any standard ASCII RS-232 terminal on the serial port of the Color Computer. I have a preliminary version of the software which will eliminate the display problem completely, but I imagine that many purchasers will want to use a TV set and the supplied keyboard for some time, before investing in a terminal. The enhanced display software will therefore be welcome.

A SDC (single disk copy) utility allows copying with a single drive. It reads files from the source disk until memory is full or it has read all the files to be copied, then it prompts you to insert the destination disk for a write cycle, etc., until the copy is complete. LINK and PUTBOOT.LDR both prompt you, and therefore give an opportunity to change disks so these operations may

be performed with a single disk drive also.

The HELP utility and file help you find or remember FLEX commands. If, for example, you type HELP,NEWDISK you will get a brief description of what the NEWDISK utility does, and a reference to a page in the manual.

If you have a serial printer, you will have no trouble configuring the system so you can use it effectively. A parallel printer will require a serial adaptor of some sort. Epson provides one for their printers, and Computerware of Encinitas, CA, offers one for about \$60.

Of course you can run Radio Shack Extended Disk BASIC, which comes in the Color Computer in ROM. The RS disk operating system is well thought out. Both Random Access and Sequential files are implemented. Since the Color Computer comes up running the BASIC from ROM, you might wonder where the operating system is. Actually, it is part of BASIC. While running BASIC you may DIR a disk (prints the directory of a RS disk). You may copy or back up a disk, load and save programs (either BASIC or machine language), and still in BASIC, you may read or write any sector on the disk by specifying the track and sector number, and the ID of two string variables. The first 128 bytes of the sector is read to/written from the first named string variable, and the last 128 bytes to/from the second. That means you can write your own disk system and have fast access! Naturally, the RS BASIC has all the color graphics commands and sound commands, so you can write game programs and/or use graphics.

The Color Computer is a good buy for anyone wanting to get into this expensive hobby with a small investment. If you have the minimum system from RS, which is very inexpensive, you can first have RS upgrade your Color Computer to 32K, and then do the very simple modification to 64K. From that point, you are off into the world of FLEX, with at least five Pascal compilers, three or four BASIC interpreters, several versions of "C", Fortran, Cobol, a couple versions of FORTH, three editors, a good text processor, several assemblers, an excellent debugger program for assembler programs, and much more.

Mr. Anderson is vice president in charge of engineering for Industrial Computer Controls Corp. in Ann Arbor, MI. You may contact him at 3540 Sturbridge Ct., Ann Arbor, MI 48105.

Binary Arithmetic Operations

by Joe Hootman

A short discussion of the various instructions for binary arithmetic including addressing and sign information.

The most extensive list of instructions, and some of the most frequently used, are the Binary Arithmetic Operations (table 1). Most of the binary operations are straightforward however, there are several instructions unique to the 68000.

The binary operations usually do not apply to operations on the address registers. However, in the binary arithmetic instruction implementation of the 68000, there are several instructions such as ADDA, CMPA, and SUBA that are designed for operation on the address register. The operations on the address register allow special addressing operations to be carried out and, more importantly, allow the comparison of the magnitude of the address register without using the CHK instruction. Clearly the address registers can be used as data registers or index registers. Three instructions deal with sign extension: ADDX, EXT, and NEGX. All of the sign extension instructions sense the sign bit of the operation and the sign is extended through the length of the word.

When arithmetic instructions are considered, the implementation of the signed multiply and divide and the unsigned multiply and divide must be considered a most worthwhile and powerful addition to the instruction set. The signed and unsigned multiply and divide instructions are all 16-bit instructions. The data to be operated on is a word in length; the result of the operation is 32 bits long (long word). The interpretation of the 32 bits depends on the particular instruction. For example, if D0 contains \$8055, D1 contains \$0002, and MULS D1, D0 is executed, the result (\$FFFF00AA) will

be left in data register D0. Since the most significant bit of the word is set, this indicates that the result is negative and the N bit is set in the CCR. If D0 contains \$8055, D1 contains \$0002, and MULU D1, D0 is executed, then the result (\$000100AA) will be in D0.

The signed and unsigned divide have characteristics similar to the multiply instructions. If division by zero is attempted, a trap will occur and overflow is indicated by the state of the V bit in the CCR. If Z is set then the

quotient is zero. The N bit follows the most significant bit of the result. In both the signed and unsigned divide the quotient is the lower 16 bits of the destination register and the upper 16 bits is the remainder. The sign is reflected by the most significant bit of the result.

The TST instruction subtracts the designated data from zero and the appropriate bits set in the CCR. This instruction testing of byte, word, and long word data is reflected in the CCR.

Table 1: Binary Arithmetic Operations

*The addressing modes will be covered in future issues.

Mnemonic	Data Size/CCR	Function	Comments																																												
ADD	8, 16, 32 CCR X N Z V C * * * * *	Add Binary	<p>This operation adds the binary data designated by the source to the data designated by the destination and leaves the result in the destination. If the effective address is a source then all addressing modes can be used.</p> <p>Opword Format</p> <table><tr><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>1</td><td>1</td><td>0</td><td>1</td><td colspan="2">Register</td><td colspan="2">Op Mode</td><td colspan="4">Effective Address</td><td colspan="2">Mode</td><td colspan="2">Register</td></tr></table> <p>Register — Any of the eight data registers.</p> <p>Op Mode</p> <table><tr><td>Byte</td><td>Word</td><td>Long Word</td><td>Operation</td></tr><tr><td>000</td><td>001</td><td>010</td><td>Dn + EA → Dn</td></tr><tr><td>100</td><td>101</td><td>110</td><td>EA + Dn → EA</td></tr></table> <p>The source can have all the address modes except 13, 14.*</p> <p>The destination can have all the address modes except 1, 2, 10, 11, 12, 13, 14.*</p>	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	1	1	0	1	Register		Op Mode		Effective Address				Mode		Register		Byte	Word	Long Word	Operation	000	001	010	Dn + EA → Dn	100	101	110	EA + Dn → EA

Table 1 (continued)

Mnemonic	Data Size/CCR	Function	Comments
DIVS	16 CCR X N Z V C - * * * 0	Signed Divide	<p>This operation divides the destination by the source. The result is left in the destination. The source is a 16-bit word and the destination is a long word operation. The lower 16 bits are the quotient and the remainder is in the upper 16 bits; the sign of the remainder is the same as dividend unless the remainder is zero. Division by zero causes a trap. Overflow may be detected and flagged but the operation is unaffected.</p> <div> 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 1 0 0 0 Register # 1 1 1 Effective Address Mode Register </div> <p>The register # specifies one of the eight data registers and this is the destination register. The effective address determines the source and all EA modes can be used except 2, 14.*</p>
DIVU	16 CCR X N Z V C - * * * 0	Unsigned Divide	<p>The unsigned divide is identical to the signed divide except that unsigned arithmetic is used.</p> <div> 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 1 0 0 0 Register # 0 1 1 Effective Address Mode Register </div> <p>The addressing modes and the definition in the opword are the same as the signed divide.</p>
EXT	16, 32 CCR X N Z V C - * * 0 0	Sign Extend	<p>This instruction extends the sign bit of a byte to a word or a word to a long word. The MSB is detected and extended to the proper length. The sign bit is considered to be the most significant bit of the word.</p> <div> 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 0 1 0 0 1 0 0 Op Mode 0 0 0 Register </div> <p>Op Mode field specifies the size of the extension. 010 - Word sign extension 011 - Long word sign extension</p> <p>Register field specifies one of eight data registers.</p>
MULS	16 CCR X N Z V C - * * 0 0	Signed Multiply	<p>This operation multiplies two signed words together. The destination must be a specified data register. The sign of the operation is reflected in the sign bit.</p> <div> 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 1 1 0 0 Register 1 1 1 Effective Address Mode Register </div> <p>Register field specifies one of the data registers and is a destination register.</p> <p>All effective addressing modes can be used except Direct, Quick, Immediate, and Implied 2, 13, 14.*</p>
MULU	16 CCR X N Z V C - * * 0 0	Unsigned Multiply	<p>This operation multiplies two 16-bit integers together and leaves the result in the destination register. The operations are similar to the signed multiply except that signed arithmetic is not used. The 32-bit result is left in the destination register.</p> <div> 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 1 1 0 0 Register 0 1 1 Effective Address Mode Register </div> <p>Register field specifies one of eight data registers.</p> <p>The effective address can be anything but Direct, Quick, Immediate, and Implied 2, 13, 14.*</p>

How to Make a Graphic-80 PET from a 4016

by James Strasma

A "Graphic 80" is an 80-column PET with the graphic-style keyboard. It can be made from a 4016 (Commodore's cheapest PET) by adding some inexpensive, readily available ICs and moving some jumpers. The author provides step-by-step instructions. In addition, instructions are provided to add extra keys to an 8032 or a Graphic 80.

The CBM 8032 offers an 80-column screen and a very business-oriented keyboard. Many PET owners would like to have the 80 columns, yet still maintain the easy access to graphic characters that the "graphic" keyboard offers. This does take some soldering and electronic assembly skill.

This article shows how to upgrade a "Fat Forty" 4016 or 4032 to a graphic keyboard, 80-column machine. There are several options available, including only upgrading to 32K, making a business-keyboard 8032, and adding extra keys to control video functions not previously accessible from a single key.

Before you begin, note that these changes are for ASSY. NO. 8032089, located on the right edge of the board, halfway back, the FCC-approved Universal Dynamic PET main board. Similar changes worked with earlier boards, as long as the computer came with the large, 12-inch screen.

Also note that procedures described below void any Commodore warranty, guarantees non-support by them, and cannot be guaranteed to work on your particular machine.

The traces on current PET computer boards are very tiny, and easily destroyed. Do not attempt this project unless you are skilled with a soldering iron. Before you start, unplug your machine for your safety and the computer's.

Install sockets where new chips are added. This makes the job easier and makes later repairs more convenient.

To make a 4032 from a 4016

- Insert 4116 dynamic RAM chips in the vacant positions of column UA. These include UA4, UA6, UA8, UA10, UA12, UA14, UA16, and UA18, eight in all.

- At the right front of the board, find the right end of jumper Y, and re-route that end to the next hole toward the rear, at the right end of a line labeled Z. (See figure 1.) Your PET will now display "31743 bytes free" when it is powered on. If it doesn't, check your connections.

To make an 80-column machine from a 4032

- Move the right end of all ten jumpers at BA0 one hole to the rear. (See figure 2.)

- Just behind jumpers Y and Z, move the right end of the jumper labeled both 3 and 40 one hole to the rear, the right end of the line marked 4 and 80. (See figure 1.)

- Remove the short between pins 10 and 11 of UD2 from the bottom of the board, and repair those pins' connections on the top side of the board. If

you damage this chip, it can be inexpensively replaced. (UD2 is the chip in the upper-left of figure 1.)

- Remove the jumpers at 6 and 7 between UB2 and UC3. (See figure 3.)

- Add jumpers at 5 and at 8 in the same area (figure 3). The jumper at 8 should be between the most widely separated of its four holes.

- Add 2114 static RAM chips at UC6 and UC7.

- Add 74LS244 octal tri-state driver chips at UB6 and UB7.

- Add a 74LS373 tri-state octal D flip-flop chip at UB8.

- Replace the 2K ROM at UD7 with a suitable replacement, as described in the next section.

To make the result a business-keyboard 8032

- Buy or program a ROM for UD7 identical to the one supplied in that position on the 8032. Commodore's part number is 901474-03. The correct EPROM substitute is a single 5-volt supply 2716.

- Buy and install a business-keyboard in place of the graphic one

Figure 1: Detail of front of board showing positions of jumpers Y, Z, 3, and 4, and IC UD2.

supplied. Since the cutouts will not match, the lower portion of the hood should be replaced, or you can make your own mounting plate.

To make the result a G80

□ Create a custom 2716 EPROM for UD7, or obtain one from a user group. The only change is to take the 80-byte keyboard look-up table from locations \$E798-\$E7E7 in the Fat Forty ROM, and copy it into the functionally equivalent location in the 8032's ROM, starting at \$E6D1. With this change, the G80 will lack only the REPEAT, ESCAPE, and TAB keys of the 8032.

However, as long as you have made the decision to modify the ROM, why not improve it? By changing only a few bytes, you may add not only the missing keys, but also up to four others.

Listing 1 shows my keyboard look-up table, which includes keys for TEXT/GRAPHICS, INSERT/DELETE LINE, ERASE TO BEGIN/END, and an optional value for SET TOP/BOTTOM OF SCREEN. The details are described later in the article.

Adjusting the Screen

There is a slight problem with the video adjustment that appears when CHR\$(14) is printed. The top and bottom lines disappear! To fix this, adjust the potentiometer labeled HEIGHT, from below the video display board, using a small non-conductive screwdriver. Bear in mind that parts of this board carry over 10,000 volts, even when the computer is unplugged!

Using the program below, adjust the pot so the test pattern just fills the screen:

```
10 PRINT CHR$(14)
20 FOR I = 1 TO 1999
30 : PRINT "#";
40 NEXT
50 GOTO 50
```

The same fix works on any Fat Forty.

To add missing and extra keys pull off the keyboard connector at the keyboard. Note that it has 18 separate connections. These correspond to the ten rows and eight columns of the keyboard matrix as shown in listing 1.

There is a small hole at each position in this connector. Using micro test clips available from Radio Shack, you can make temporary connections.

For a slightly more permanent attachment, I soldered tiny loops of wire to the keyboard side of the connector, as shown in figure 4. From the right edge of the keyboard connector, as viewed in place, the ten rows of the keyboard matrix are the first ten wires from the right. The eight columns of

Listing 1

:: E6D1	3D	2E	10	03	3C	20	5B	12
:: E6D9	2D	30	00	3E	19	5D	40	00
:: E6E1	2B	32	0E	3F	2C	4E	56	58
:: E6E9	33	31	0D	3B	4D	42	43	5A
:: E6F1	2A	35	1B	3A	4B	48	46	53
:: E6F9	36	34	15	4C	4A	47	44	41
:: E701	2F	38	16	50	49	59	52	57
:: E709	39	37	5E	4F	55	54	45	51
:: E711	14	11	09	29	5C	27	24	22
:: E719	1D	13	5F	28	26	25	23	21

Figure 2: Detail showing jumpers BA0 - BA10 and position of replacement EPROM at UD7.

Figure 3: Detail showing jumpers 5, 6, 7, and 8.

Figure 4: Added loops at keyboard connector and clip connections.

the matrix follow, again toward the left.

The six keys I have added are all in column 3 of listing 1. This corresponds to the thirteenth wire from the right. It is the one with two micro test clips in figure 4. Each of these wires connects to one pole of an added key (or push button, as I implemented it).

Rows 1, 3, 5, 6, 7, and 9 contain the added keys. Connect each one to the unused pole of the appropriate added "key." One more key could be added by attaching wires to row 2 and column 5. These correspond to positions 2 and 15 from the right end of the connector, and would be mated through another key.

If you prefer to implement another keyboard value, substitute your preferred PET ASCII value into the keyboard look-up table of listing 1. For instance, if you replace the \$03 at location \$E6D4 with \$07, then hitting the STOP key would ring the chime rather than halting running programs.

I chose to mount push buttons through the bezel surrounding the video screen, as shown in figure 5. I used Radio Shack's tiniest push buttons because they are unobtrusive, easier to push than large ones, and I couldn't find regular keyswitches. Regular keyswitches could be used, or a surplus keypad could be wired up.

One method for making the G80

Figure 5: Micro push buttons added near screen. Three additional buttons were installed on the other side.

selectable between 40 and 80 columns requires three ICs to switch the necessary lines. This plan offers a simpler solution. It uses a 2732 EPROM, pre-programmed to mimic any two BASIC 4.0 ROM sets, and switches from one to the other by grounding one pin.

The disadvantage of this method is that the 40 columns appear smaller and centered on an 80-column screen, rather than occupying the full width, as on a Fat Forty.

For information on how to obtain this chip, see the box on this page.

Software Compatibility

Nearly everything for the 8032 also works on the G80, especially after adding the missing keys. This includes the 8096 memory expansion board, Silicon Office, COMAL, and VisiCalc 8096. The exceptions are complete languages, including UCSD Pascal, the former PET BASICs supplied with the 8096 board, and A.B. Computer's "Expanded BASIC" for the 8096. By modifying the programs, I have been able to get all but UCSD Pascal to work with the G80.

You may contact the author at 1280 Richland Ave., Lincoln, IL 62656.

MICRO

Obtaining Alternate ROMs

To order alternate ROMs for Commodore 8032 and G80 computers, write:

Jim Russo
Ann Arbor Terminals, Inc.
6175 Jackson Road
Ann Arbor, MI 48103

You may request any two of the following variations of BASIC 4:
Fat Forty (Current model, but centered on an 80-column screen.)
Skinny Forty (Also centered; works with far more games. No repeat function.)
Eighty (Same as the 8032.)

Be sure to specify whether the ROM is for a G80 or an 8032. I think the charge is still \$10 per ROM, barely above the cost of the 2732 itself.

ANDROID ATTACK

FOR  ATARI

Fight your way down through the Top-Secret underground laboratory to save the runaway nuclear reactor, then try to save yourself before the Androids get you!

CoCo Bits

By John Steiner

Ed. note: This is the first of our Color Computer columns. John will be augmenting our coverage of 6809 computers and helping to recruit authors.

This column will have two major goals: to provide news about the TRS-80 Color Computer, and to provide a clearing-house for CoCo information. In addition, I hope to pass along any information on the 6809, the 6847 video display generator, and the other major components CoCo has.

Originally, it seems, Tandy developed CoCo to compete with Atari, the VIC 20, and other game machines of similar style. Witness the use of ROM program packs for games, etc. This emphasis seems to be changing slightly. Just recently, Tandy has taken the 4K machine off the market and replaced it with a 16K version, at the same price. With the addition of the 32K upgrade (which uses 64K chips), CoCo has entered a new world. The newer, more powerful machine has been easily converted to 64K and given the capacity to run FLEX. OS-9 will probably be available by the time you read this. These two powerful operating systems allow a vast range of 6809 software to be executed from CoCo. As I learn more details of these CoCo expansions, I will pass them along.

Since this is the games issue, I have some game-oriented information this month. If you have a Color Computer disk system, you have no doubt been frustrated by the fact that the CoCo DOS scratchpad is located at \$600, just where many machine-language tape programs like to reside. I am grateful that Tandy has started releasing some software on tape since disk users have trouble getting the disk drive and a ROM pack in the ROMport at the same time. It is a shame, though, to have to spend several minutes loading a 14K adventure game from tape, when that expensive disk system just sits there taking up space.

I purchased "BEDLAM," an adventure game on tape, and decided I would have to transfer it to disk. Being a

relative beginner to machine-language programming and only having experience with the 6800, I have been waiting for Tandy's assembler (though others became available, I had a deposit on Tandy's). When it finally arrived, I plugged in the EDTASM+ ROM pack (doggone it, there went the disk again), and loaded BEDLAM using an offset of 16384. Using the monitor, I found the start and end addresses, and tacked a little routine at the end. This routine, shown below, moves the program, one byte at a time (I forgot about the D register) down to \$600. It then transfers execution to \$600, the start address of BEDLAM.

You may enter and assemble the listing yourself, or enter the object code from the assembler listing using a monitor. Once the routine is in place, beginning at \$7F02, use CLOADM "BEDLAM",16384 to load in BEDLAM. Transfer the whole thing to disk with the command SAVEM "BEDLAM", &H4600, &H7F15, &H7F02. Notice the execute address is the start address of the memory move routine. To run the program, you can just use LOADM "BEDLAM": EXEC, or you can write a BASIC load routine, and let BASIC do the work for you with a simple RUN "BEDLAM".

Once the program has been loaded into the region at \$600, disk BASIC is essentially gone. The quick and dirty method to restore DOS is to shut the computer off, then turn it on again. A better way is to let RESET do it for you.

CoCo BASIC has two options in its reset routine: a cold start and a warm start. When RESET is pressed, memory location 113 is checked for \$55. If found, a warm start is done, any program in memory is saved; string memory, number of graphics pages reserved, and other parameters are kept. If, on the other hand, anything but \$55 appears, BASIC assumes a cold start and reconfigures the system to power up status. This little trick will recover our disk when we are through with BEDLAM. Before loading the program, from BASIC enter POKE 113,0. Alternatively, you could add a routine at the beginning of the machine-language loader that will store a zero into location 113 before executing BEDLAM. When you are ready to quit BEDLAM, just press RESET. DOS will be reconnected. You will not be missing any fancy end routine by leaving BEDLAM in this manner.

A quirk of this and the other Radio Shack adventure games I've seen is their STOP or QUIT command. I would have expected control to return to BASIC. What happens is that the keyboard will lock up, causing you to turn off the computer or press RESET to regain control. As long as you have to press RESET anyway, you might as well reconnect the disk. Though not particularly fast or fancy, you can use the routine on any 32K machine to transfer programs. Just substitute the correct start, end, and execute addresses where required.

```

*
*          ORG    $7F02
*PROGRAM TO MOVE BEDLAM*
*JOHN STEINER 8/1/82*
7F02 8E      4600  START  LDX    #$4600      Load current start address
7F05 108E    0600      LDY    #$600        Load new start address
7F09 A6      80       MOVE   LDA    ,X+      Load byte from current address
7F0B A7      A0       STA    ,Y+      Store byte to new address
7F0D 8C      7F01     CMPX   #$7F01      Done yet!
7F10 26      F7       BNE    MOVE         If not go do it again
7F12 BD      0600     JSR     $600
                                END

```

One more programming hint for this month. Disk users are told by the disk system manual that "COPY" is available for only multi-drive users. This is incorrect. If you have a single disk drive, you can enter COPY "filename/ext". You will be prompted as to when to switch disks. In addition, unlike BACKUP and DSKINI, COPY is non-destructive of the program in memory. If you have a long program in memory and a large file to copy, however, you may have to switch disks a couple of times. COPY can be used to transfer any file type, and easily transfers machine-language or data files. I will have more details on COPY next month, including a small routine that assists in selective disk backups.

I am an electronics instructor by profession, and would like to make a couple of comments on CoCo in school. Tandy is developing courseware that runs on the Color Computer. CoCo will be making appearances in classrooms around the country if Tandy has anything to say about it. By the time you read this, teachers will have access to programs such as Chemistry Simulations. Radio Shack's Talk/Tutor

development system is the medium for several recently released educational packages, including Vocabulary Tutor I, and Inventions That Changed Our Lives. Talk/Tutor programs make good use of the high-resolution graphics and audio features of CoCo.

In addition to these and other educational software, Color PILOT will have been released. PILOT has been used by many instructors who wanted to develop computer-assisted instruction, yet did not want to learn the complexities of BASIC. Color LOGO, another popular language with educators, should also be available. Both programs will have disk versions; LOGO will also be on ROM pack.

I am looking forward to comments from readers. I plan on including programming hints, and CoCo- and 6809-related news. In addition, CoCo disk users are probably a distinct minority and I will have information on Color BASIC and Extended BASIC, as well as disk BASIC. I can be reached at 508 Fourth Ave. NW, Riverside, ND 58078, or contact me through MICRO.

PERRY PERIPHERALS REPAIRS KIMs!! (SYM's AND AIM's TOO)

- We will Diagnose, Repair, and Completely Test your Single Board Computer
- We Socket all replaced Integrated Circuits
- You receive a 30-day Parts and Labor Warranty
- Your repaired S.B.C. returned via U.P.S. — C.O.D., Cash

Don't delay! Send us your S.B.C. for repair today
Ship To: (Preferably via U.P.S.)

PERRY PERIPHERALS

6 Brookhaven Drive

Rocky Point, NY 11778

KIM-1 REPLACEMENT MODULES

- Exact replacement for MOS/Commodore KIM-1 S.B.C.
- Original KIM-1 firmware — 1K and 4K RAM versions

REPLACEMENT KIM-1 KEYBOARDS

- Identical to those on early KIMS — SST switch in top right corner
- Easily installed in later model KIMS

Perry Peripherals is an authorized HDE factory service center.

Perry Peripherals carries a full line of the acclaimed HDE expansion components for you KIM, SYM, and AIM, including RAM boards, Disk Systems, and Software like HDE Disk BASIC V1.1. Yes, we also have diskettes. For more information write to: P.O. Box 924, Miller Place, NY 11764, or Phone (516) 744-6462.

HUDSON DIGITAL ELECTRONICS INC.

THE TASK* MASTERS

HDE supports the *TIM, AIM, SYM and KIM (TASK) with a growing line of computer programs and peripheral components. All HDE component boards are state-of-the-art 4½" x 6½", with on board regulation of all required voltages, fully compatible with the KIM-4 bus.

OMNIDISK 65/8 and 65/5

Single and dual drive 8" and 5¼" disk systems. Complete, ready to plug in, bootstrap and run. Include HDE's proprietary operating system, FODS (File Oriented Disk System).

DM816-M8A

An 8K static RAM board tested for a minimum of 100 hours and warranted for a full 6 months.

DM816-UB1

A prototyping card with on-board 5V regulator and address selection. You add the application.

DM816-P8

A 4/8K EPROM card for 2708 or 2716 circuits. On board regulation of all required voltages. Supplied without EPROMS.

DM816-CC15

A 15 position motherboard mounted in a 19" RETMA standard card cage, with power supply. KIM, AIM and SYM versions.

DISK PROGRAM LIBRARY

Offers exchange of user contributed routines and programs for HDE Disk Systems. Contact Progressive Computer Software, Inc. for details.

HDE DISK BASIC

A full range disk BASIC for KIM based systems. Includes PRINT USING, IF ... THEN ... ELSE. Sequential and random file access and much more. \$175.00

HDE ADVANCED INTERACTIVE DISASSEMBLER (AID)

Two pass disassembler assigns labels and constructs source files for any object program. Saves multiple files to disk. TIM, AIM, SYM, KIM versions. \$95.00

HDE ASSEMBLER

Advanced, two pass assembler with standard mnemonics. KIM, TIM, SYM and KIM cassette versions. \$75.00 (\$80.00 cassette)

HDE TEXT OUTPUT PROCESSING SYSTEM (TOPS)

A comprehensive text processor with over 30 commands to format and output letters, documents, manuscripts. KIM, TIM and KIM cassette versions. \$135.00 (\$142.50 cassette)

HDE DYNAMIC DEBUGGING TOOL (DDT)

Built in assembler/disassembler with program controlled single step and dynamic breakpoint entry/deletion. TIM, AIM, SYM, KIM AND KIM cassette versions. \$65.00 (\$68.50 cassette)

HDE COMPREHENSIVE MEMORY TEST (CMT)

Eight separate diagnostic routines for both static and dynamic memory. TIM, AIM, SYM, KIM and KIM cassette versions. \$65.00 (\$68.50 cassette)

Castle Adventure for PET and Apple

by David Malmberg

Castle Adventure is a role-playing game that involves traveling throughout a dangerous castle in search of treasure. The goal is to rescue the princess, while avoiding the many dangers about you.

Castle Adventure requires:

PET/CBM with 32K
or Apple II with 48K
or other Microsoft BASIC
computer

In CASTLE ADVENTURE you play the role of Godfrey de Goodheart, a bold, but impoverished knight. King Fredrick III has dispatched you to rescue his only daughter, the beautiful Princess Fatima, from the dungeons of Baron von Evil's castle. You have also been asked to capture the Baron's treasures of gold, silver, and gems, which he amassed by cruelly exploiting his serfs. If you can rescue the princess and return with all of the Baron's ill-gotten treasures, King Fredrick has promised you Princess Fatima's hand in marriage.

Your quest will be filled with peril. The seven lone knights who were previously sent on this crusade all vanished without a trace. If you are to succeed where so many others have failed, you must use all your strength and cunning — and be very lucky!

During your quest the computer will be your guide. You take action by giving the computer a series of one- or two-word commands, such as: GO SOUTH (or just "S"), OPEN DOOR, GET KEYS, LEAVE CHEST, SWIM. The computer has a vocabulary of only about 100 words. If it does not understand your command, try something else. A complete list of this vocabulary

is purposely not included. At least half the fun will be establishing the computer's lexicon. Several commands will be particularly useful:

- INVENTORY (or just "I") will give you a list of all the items you are carrying.
- LOOK (or just "L") may reveal significant details that may help you in your quest.
- HELP (or just "H") may result in a valuable hint.
- SAVE will cause the current status of the game to be saved on tape or disk.
- LOAD will enable you to resume a previously saved game.
- SCORE will show you the total number of points you have earned so far.
- QUIT will end the game and show you your final score.

Remember that everything you encounter in your adventure has a purpose. There are plenty of clues, but it will take imagination, perseverance, cunning, skill, and most of all luck to win the Princess's hand.

Converting to Other Computers

CASTLE ADVENTURE, as shown in listing 1, is written for a 32K PET/CBM computer. Listing 2 shows changes required for an Apple II. However, the program is written in "standard" Microsoft BASIC, so conversion to other Microsoft machines should be a relatively trivial task. There are only three areas where changes to the program will have to be made.

First, you will have to replace the screen and cursor control commands of the PET. These are shown in the listing within square brackets in their "English equivalents" so their meaning should be fairly obvious; i.e., CLR means clear the screen, 3 DOWN means move the cursor down three rows, etc. CASTLE ADVENTURE is written for a 40-column screen, so no spacing changes will be required for the

Atari (with Microsoft BASIC) or other 40-column systems.

The second change is to convert the LOAD game (lines 24 to 36) and SAVE game (lines 219 to 233) routines so they will be compatible with your machine's tape and/or disk command formats. The variables you want to SAVE and LOAD are: SF, LX, DF, R, and the array IA(.), which has 12 elements (including a zero-th element).

The last thing to change is the reference to the PET ROMs in line 390.

Acknowledgement

Many of the ideas in CASTLE ADVENTURE, as well as other adventures that are widely available, owe a tremendous debt to Scott Adams. In the specific case of CASTLE, it uses a database structure and table-driven logic similar to those first described by Adams in several articles. These articles are a *must* for the true adventurephile:

1. "An Adventure in Small Computer Game Simulation," *Creative Computing*, (August 1979). Describes the data-base structure.
2. "Adventureland," *Softside*, (July 1980). Describes the table-driven logic.
3. "Pirate's Adventure," *BYTE*, (December 1980). Also describes the table-driven logic.

Castle Adventure listing begins on page 42. The changes for Apple II (listing 2) are on page 46.

David Malmberg is the author or co-author of several personal computer packages; the most recent is *VIC Turtle Graphics* published by Human Engineered Software. You may contact him at 43064 Via Moraga, Fremont, CA 94539.

ROCKWELL Microcomputers from Excert, Inc.

THE AIM 65/40 Single Board or Smorgasbord

- A full size terminal style keyboard w/8 special function keys
- A smart, 40 character display with its own microprocessor
- A 40 column printer w/text and graphic output
- Up to 64K of on-board RAM and ROM
- On-board interfaces include RS232, dual audio cassette and 2 user I/O R6522 devices
- Firmware includes interactive monitor and text editor w/options of Assembler, BASIC, FORTH and PL/65

THE AIM 65 Take-Out Order

- A full size terminal style keyboard w/3 special function keys
- A 20 character display
- A 20 column printer w/text and graphic output capability
- Up to 4K RAM and 20K ROM on-board
- On-board interfaces include 20MA TTY, dual audio cassette and 1 user I/O R6522 device
- Firmware includes interactive monitor and text editor w/options of Assembler, BASIC, FORTH, PASCAL, & PL/65

And if the above isn't enough,
Try the RM65 — a product line filled with embellishments including:

32K DRAM Board
CRT Controller
Floppy Disk Controller
PROM Programmer

ACIA Board
IEEE-488Board
CPU/SBC Board
4-16 Slot Card Cages

Prototype cards
Adaptor Buffer Modules
General Purpose I/O Board
PROM/ROM Board

NEW LOWER PRICES AND A CASH DISCOUNT* TO BOOT!

SYM 23 Matches

by Matt Ganis

Two players alternate, removing matches from a pile of 23; the player taking the last match loses. On each turn a player may take 1, 2, or 3 matches.

23 Matches

requires:

1K SYM

In this version of the game the human challenges the computer. Key in G 0200 to begin the game. The LEDs will go blank and the SYM will wait for you to press any key on the keypad. Once this is done the computer informs the player that it is his turn. At this point the player enters either a 1, 2, or 3 (taking away 1, 2, or 3 matches). The SYM will inform the player of the number of matches it is taking by scrolling the message 'I SELECT....'

Modifications to the program are very simple:

1. To change the speed of the messages that scroll on the display, decrement the value at location \$02FA.
2. To make the computer move first, change the 0 at location \$0204 to 1.
3. To alter the number of matches used, change the \$17 (hex \$17, decimal 23) to the number of matches desired.

The only part of the program that might be used in another program is the 'display-a-message' routine at location \$02EE. This routine will scroll a message across the SYM displays starting at the right-most display and ending at any desired display. Just set the zero page pointer (PTR) to the location of the message [lo, hi], and load the Y register with the number of displays to be used minus one. Then do a JSR MESSAGE.

Mr. Ganis studies computer science at PACE University (Pleasantville/Briarcliff). He may be contacted at Sheridan Road R.D. #3, Lebanon, NJ 08833.

MICRO™

New Publications

40 Computer Games from Kilobaud Microcomputing, edited by Emily A. Gibbs and Jim Perry. Wayne Green, Inc. (Peterborough, NH), 1980, 148 pages, paperback. \$7.95

40 Computer Games offers you some of the best game programs from recent issues of *Kilobaud Microcomputing*. Nine game categories offer something for everyone. Accompanying articles explain how to play the games and increase the odds to beat the computer. The games are written in different languages for various computer systems.

CONTENTS: Gambling; Racing; Space; Board Games; Card Games; Guessing Games; Puzzles; Calculators; Odds and Ends.

Science and Engineering Sourcebook by Cass Lewart. Micro Text Publications Inc. (One Lincoln Plaza, Suite 27C, New York, NY 10023), 1982, 95 pages, 6 x 9 inches, paperback. ISBN: 0-942412-02-8 \$9.95

A book of professional applications programs for the TRS-80 Pocket Computer. The programs cover problems in the field of electrical engineering, statistics, queuing theory, reliability, graph generation, artificial intelligence, and related technical disciplines. A table of conversions make the translation of these programs applicable to other BASIC computers.

CONTENTS: Foreword; Introduction; Electrical Engineering; Data Transmission; Number Theory; Computer Programming; Computer Generated Plotting; Probability and Statistics; Mathematics; Operations Research; Miscellaneous; Appendix.

Games for the ATARI, by S. Roberts. Elcomp Publishing, Inc. (53 Redrock Lane, Pomona, CA 91766), 1982, 115 pages, paperback. ISBN: 3-911682-84-3 \$7.95

Games for the Atari provides ideas on how to create your own computer games. This booklet deals primarily with BASIC examples with only one example in machine language. Atari programs show the possibilities of using both graphics and sound features.

CONTENTS: Drawing Figures on the Screen; Movements in BASIC; Movements in Machine Language; Movements of Missiles; Overlapping Detection; Sound-

Apple II Assembly Language, by Marvin L. De Jong. Howard W. Sams & Co., Inc. (4300 West 62nd St., Indianapolis, IN 46268), 1982, 334 pages, 5 1/4 x 8 1/2 inches, paperback.

ISBN: 0-672-21894-1 \$15.95

This is a 6502 assembly-language manual written for the beginning assembly-language programmer on the Apple II. Dr. De Jong introduces each topic in a building-block concept, starting with a description of a microcomputer and continuing through interrupt programming and real-time applications. The book is carefully written and well illustrated with programming examples. The only possible flaw with the book is that it quickly gets technical after the first half dozen chapters. If the reader were truly a beginner, he would find the material difficult.

CONTENTS: The Microcomputer System; Writing and Executing Simple Assembly-Language Programs; Branches and Loops; Logical Operations and Shift and Rotate Operations; Arithmetic Operations; Addressing Modes: Indexed Addressing; Subroutines, The Stack and Interrupts; Additional Programming Topics; Programming with the 6522; Applications; Decimal, Binary, and Hexadecimal Number Systems; Additional Circuits and Programs; Pin Diagrams of Some Integrated Circuits; Index.

Phil Daley
MICRO Staff

Kids and the Apple, by Edward H. Carlson. Reston Publishing Company, Inc. (Reston, VA), 1982, 218 pages, paperback.

ISBN: 0-8359-3669-4 \$19.95

This book teaches Applesoft BASIC on both disk-based or cassette Apple systems to children from 10-14 years old. The book is intended for self-study, but may also be used in a classroom setting. The lessons contain explanations, examples, exercises, and review questions. Notes for the instructor summarize the lesson material, provide helpful hints, and give good review questions.

CONTENTS: Introduction; Graphics, Games, and All That; Advanced Programming.

MICRO™

Chances are, when you bought your first disk drive, it was an Apple. Now that you're ready for a second, take a look at Quentin.

Our Apple*-Mate™ 5¼" Disk Drive is fully software transparent with Apple's DOS 3.3 operating system in full and half track operation.

Add it to your present drive for greater capacity and faster access. Just plug it in and go to work.

And the Apple-Mate has these High Performance advantages:

ON TRACK HEAD SEEK

A precision lead screw positions the head onto the correct track. Time-consuming retries and disk-to-disk copying errors are virtually eliminated.

SIEMENS† DISK DRIVE

The apple-beige unit is built around the highly reliable

Siemens system with over 10,000 lifetime hours. Shielded connecting cable also attached.

LONG TERM DEPENDABILITY

MTBF (Mean Time Between Failures)—8,500 power-on hours, and the unit has a one-year warranty.

COUNT ON QUENTIN FOR QUALITY

Quentin Research was building disk systems for the computer industry when Apple was a little bud on the big computer tree. We're known for product reliability and stand behind every system we sell you.

But the best news may be the price—only \$335.00 (40 tracks).

A special introductory offer when you order Apple-Mate directly from us.

So when you're ready to boost the juice on your Apple, add-on the Quentin Apple-Mate.

To order: Check, money order, Visa or Mastercard number. Calif. residents add 6% sales tax. Allow one week delivery.

Solve the Pagoda Puzzle Using Recursive Assembly

by Sherwood Hoyt

This routine solves the "Pagoda" or "Tower of Hanoi" puzzle, using a recursive subroutine — one that calls itself. Four stacks are maintained for passing parameters.

Pagoda Solver requires:

6502 computer with 2K
(uses 13 page-zero locations,
and character OUTPUT and
INPUT routines — provided for
PET, Apple, and OSI OS-65D).

The Pagoda Puzzle is a game using a rectangular platform with three pegs sticking vertically out of it. The peg sticking out of the left side of the board has a number (usually eight) of discs stacked on it. The discs get smaller as you near the top of the stack (see figure 1). The object is to move the discs, which could be called a tower, from the peg on the left of the board to the peg on the right. There are only two rules to the game; move only one disc at a time, and never put a disc on top of another one so that the larger one is on top.

According to Peter Grogono's book *Programming in Pascal* (where I first read about this game and the algorithm to solve it), the game was accompanied with literature saying that priests in the Temple of Bramah played the game. When they finished their game, it signified the end of the world. Apparently the priests were playing with 64 discs. It would take roughly 18.4 billion billion moves to solve a 64-disc game. According to Peter Grogono, and some rough calculations that I made, it would take a powerful computer about a million years (if it could run that long) just to compute, not to mention print, the moves for a 64-disc game. It would take my OSI computer about 60 million years.

One function that can be used to calculate the number of moves for n discs is $(2^n - 1)$. A 4-disc game would take 15 moves; eight discs, 255. The number of moves the game takes as the number of discs goes up is exponential.

Recursion and the Tower

The recursive procedure to move the tower is quite simple; see listing 1. Let's assume that the pegs are numbered from one to three. The tower is stacked on peg 1, and is supposed to be moved to peg 3. The procedure is called initially with four parameters. NMDISC is the number of discs on the tower, FROM is set to peg 1, TO is set to peg 3, and USING is set to peg 2.

and USING receives the value of TO. The same thing is done in the third statement with FROM and USING. The second statement prints a move; a disc is taken off peg FROM and put on to peg TO. The algorithm in this procedure is used in the assembly-language program to solve the puzzle.

The trick to a recursive procedure is in maintaining distinct values for the local variables of the procedure, so that when the procedure calls itself the variables have separate values, though the names of the variables may be the same. To accomplish this, the variable values can be put on a stack (a block of memory pointed to by a stack pointer) in much the same way that return addresses for a JSR are put on the 6502 stack. In a procedure, this is done to be

Figure 1

The first operation of the procedure is to check the number of discs left on the tower. If the number is not greater than zero, control returns to the calling procedure. If the condition is true ($NMDISC > 0$), then the three statements between the IF...ENDIF are executed. The first statement is a recursive call. You can see that the number of discs passed is equal to the current number of discs minus 1, and parameters TO and USING are passed so that TO receives the value of USING

able to pull the values out of the "deep freeze" when control returns to the procedure. When a procedure is called, and there may be indefinitely many nested calls, its values are pushed on top of the stack. For the program to remember where the top of the stack is, a pointer is used that always points to the top. In my assembly-language program, the pointer is register Y, and it is incremented before a value is pushed to the stack, and decremented to pop a value off of the stack.

SERIOUS CBM® USERS

NEW FROM KILO

"The Serious Solution"

6809 + MICROWARE OS-9* + BASIC09*

Tired of the frustrating limitations of Commodore Basic? Need to get a serious programming language for your Commodore computer? KILO offers The Serious Solution. A 6809 plug in adaptor board including OS-9 Level I Operating System in ROM, Basic09* and 16K RAM expansion. The KILO 6809 adaptor board simply plugs in to your Commodore computer. The switching between 6502 and 6809 is under software control. Expansion RAM can be used to replace protection ROMs with 6502.

With The Serious Solution, all Microware software can now be run on your computer. The standard package comes with the Basic09 Structured Basic Interactive Compiler. The fastest and most comprehensive full Basic language available for the 6809. This combines standard Basic with the best features of PASCAL. It features compiler speed, interpreter friendliness and superlative debugging facilities. Option available includes Run B...a ROMable run-time system for compiled Basic-09.

Please note: The OS-9 distribution disk format is not compatible with the Commodore disk format. OS-9 software purchased from sources other than KILO may need to be reformatted. KILO will provide this service at \$10.00 per disk. Software venders should contact KILO for SS-50 to Commodore adaptor hardware and software.

SPECIAL: Buy The Serious Solution before Christmas and get Editor/Assem./Debug package for \$200.

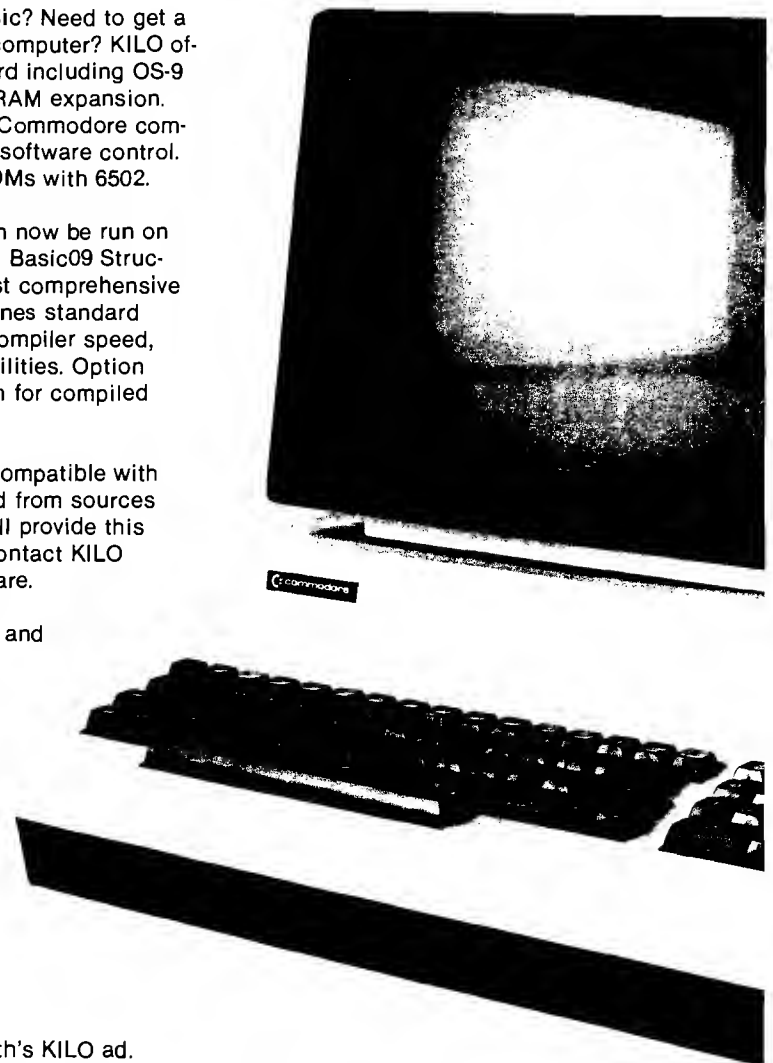

The Serious Solution	\$489
including 6809 adaptor board, OS-9 Level I operating system in ROM, Basic09 and 16K RAM expansion.	

Microware* Software Options	
PASCAL compiler	\$400
C Compiler	\$400
CIS COBOL Compiler	\$895
Editor/Assem./Debug package	\$300

VISA and Mastercard welcome. Don't forget last month's KILO ad.

Listing 1: Recursive Procedure In Pseudo-Code

```

PROCEDURE MOVE RECEIVE
(NMDISC, FROM, TO, USING)

  IF NMDISC > 0 THEN

    CALL MOVE WITH(NMDISC - 1,
    FROM, USING, TO)

    PRINT FROM, " → ", TO

    CALL MOVE WITH(NMDISC - 1,
    USING, TO, FROM)

  ENDIF

END PROCEDURE

```

The Recursive Assembly-Language Program

In the assembly-language program (listing 2), there are four zero-page locations (lines 130-160) for passing values to the recursive procedure labeled MOVE (lines 530-820). Values are passed from recursive procedural calls via these locations, as well as initially from the calling routine. The calling routine (lines 470-490) jumps to lines 1590-2360 to initialize the parameters and stack pointers. Register Y is used as the stack index, and is initialized to \$FF. When MOVE is called, register Y is incremented before the values passed are actually pushed on the stack, so that the procedure, when first called, will increment register Y to \$00, then push the values on the stack indexed by register Y.

The stack pointers are initialized next. There are four stacks, one stack for each value that is passed. When the procedure is called, register Y is incremented so that it points to a new stack position. The total number of bytes used in each stack for any given game is equal to the number of discs on the tower. Each stack occupies one page (\$00-\$FF) of memory. Actually, the stack size only needs to be one half of a page because the number of JSRs that can be executed, and therefore the number of recursive calls and separate values, is limited by the 6502's one-page stack, which can only hold \$80 two-byte return addresses. The largest tower that this program can move has approximately \$70 discs on it, which allows part of the stack to have been used already by the calling routine. However, having a maximum game of \$70 discs is obviously no problem if it would take a computer a million years just to solve a \$40 (decimal 64) disc game!

After the initialization routine stores zero in the location that holds

the current number of moves (lines 1830-1850), it stores the initial values for the FROM, USING, and TO pegs (lines 1890-1940). Then in lines 1980-2030 the prompt "ENTER TOWER SIZE:" is displayed, and lines 2080-2360 input the user response. The input routine will only accept a one- or two-digit hexadecimal number. If a one-digit number is entered, the return key must follow it. If two digits are entered, the program will continue execution and no return needs to be entered.

The next call that the calling routine makes, after initialization, is to the recursive procedure; MOVE. The first operation is to push the variables it receives onto the stack. This allows the variables for each successive calling of the procedure to be maintained separately. When the procedure is finished, the stack index will be decremented (line 810), effectively popping the variables off of the stack. The only other thing done with the variables is for the procedure to call itself with the variables (in slightly modified form) as parameters. This the procedure performs twice. Also, between the two recursive calls, the procedure calls PRMOVE from line 860-1030 to display a move. The variables FROM and TO are passed to it. FROM is the peg to

take the disc from, and TO is the peg to put the disc onto.

Trial Run

In figure 2 there are two trial runs. The first one solves the puzzle for three discs and the second for four discs. Remember, the number of discs that you enter at the prompt 'ENTER TOWER SIZE:' is assumed to be a hexadecimal number. A carriage return is required if the number entered has only one digit. (Ed. Note: The routine is written to echo the character received to the screen. If your machine's INPUT routine does this automatically, the character will appear twice on the screen. You may want to skip the echoes in lines 2130 and 2210.) A four-digit hexadecimal number in the first column of output shows the number of moves. This number will turn over to '0000' after it reaches 'FFFF'. The number in the second column tells which peg to take the disc off of and the number in the fourth column tells which peg to put the disc onto.

VIC/PET GOMOKU

by David Malmberg

A fast, machine-language version of the popular oriental game, with three user-selectable styles for the computer's play.

GOMOKU

requires:

VIC with 3K or more extra RAM and joystick or PET with 8K or more

GOMOKU is an ancient oriental game of strategy. According to Edward Lasker's book *Go and GOMOKU* (Dover, 1960), GO means "five" and MOKU means "stones." To play, you and your opponent alternate placing stones on the intersections of the lines of a square grid. One person plays with white stones and the other uses black stones. As the name implies, the object of the game is to have your stones occupy five adjacent points on a grid — vertically, horizontally, or diagonally — before your opponent gets five of his stones in a row. You must get exactly five in a row to win. Connecting two chains of stones less than five long to form a chain greater than five stones long will not win the game.

The most obvious way a player can force a win is to create a situation where he has four stones in a row with both ends of the chain open for potential stones. The opponent will be able to block only one end of the chain, so the player can win by placing a stone at the other end. To reach a forced win with an "open-four," the player must first create an "open-three." Whenever a player threatens a win by making an open-three, the opponent must immediately play a stone at one end of this chain of three in order to avoid losing the game two moves later.

As GOMOKU is played in both Japan and China, only one type of move is illegal: a participant cannot play a stone that creates more than one open-three simultaneously. The oriental

originators of GOMOKU felt that the game would not be enough of a challenge if this type of easy win were permitted.

VIC/PET GOMOKU

The computerized version of GOMOKU allows the enforcement of the no-multiple open-threes rule to be op-

tional. However, remember that if you elect to play without this restriction, the computer will play accordingly.

VIC/PET GOMOKU plays an excellent game. Its main counting and evaluation routines are written in machine language for increased speed and enhanced logic. The program takes 10 to 30 seconds between moves, depending on the density of stones on the

grid. By comparison, the first version of GOMOKU I wrote was entirely in BASIC and took from three to six minutes between moves — and it did not play half as well as the current version. VIC/PET GOMOKU should be capable of holding its own against even very good human players — especially if the computer moves first.

VIC/PET GOMOKU has three styles of play: cautious, balanced, and aggressive. These styles refer to how much the computer will weigh defensive vs. offensive moves in its evaluation of the merits of its next move. If you select a balanced style, both offense and defense have equal weights. You will find the computer will win more games when it is playing aggressively. However, when you select the cautious style for the computer, you may not be able to win often because many games will end up in stalemate;

the computer will unrelentingly block your chances for any kind of a winning pattern. When the computer loses a game, it will automatically play a more aggressive game the next time.

The VIC Version

The VIC version of GOMOKU needs at least 3K of additional memory. This can be obtained by using any of the standard VIC Super Expander, 3K, 8K, or 16K memory cartridges.

The program is written in two parts. Listing 1, the main part, is written in BASIC and should be keyed-in exactly as shown in the listing (i.e., with no unnecessary spaces to conserve memory). Listing 2, a hex-dump of the machine-language routines, shows the machine code being located from \$1300 to \$14AB. These locations assume you are using either the Super Expander or the 3K memory cartridges, which cause

the start of BASIC to be located at \$0400 (just like the PET). If you are using either the 8K or 16K memory expanders, this machine code should be located from \$2100 to \$22AB because the start of BASIC is relocated to \$1200 by the VIC's operating system. When you use a monitor to enter and save the code in the hex listing, there is no need to worry about relocating the two-byte addresses since lines 4-6 of the BASIC program automatically adjust them to correspond to the memory configuration of your VIC.

To create a working copy of GOMOKU for the VIC, first load the BASIC portion (listing 1). Then load the machine-language code you had previously saved with the monitor by

```

using the command LOAD "name", 1,1. The 1's at the end of the LOAD will load the code at its absolute location (i.e., \$1300-\$14AB or \$2100-\$22AB), rather than automatically being relocated to the start of BASIC. After both parts have been loaded, issue the command SAVE "VIC GOMOKU" and you will save a copy that combines both parts and can be used independently of whatever memory configuration is operating in the VIC.

The VIC version of GOMOKU uses the joystick to indicate your move. Once you have moved the cursor to your desired location, just hit the fire-button.

The PET Version

The machine-language code in the hex-dump (listing 2) will work without any changes in the PET. However, several lines of the BASIC program must be changed. Specifically, listing 3 contains all the lines that must be changed in listing 1 to get GOMOKU to work on the PET. In addition to these differences, lines 7, 116, 117, and 118 of listing 1 should not be included in the PET version. The BASIC instructions should be typed without any unnecessary spaces to assure that the BASIC part does not run into the

Listing 3

```
1 RL=40:S=32767:E=12*4096:V=E:A=5*4096
2 FH=RND(-TI)
3 FORI=1TO8:READX:POKE951+I,X:NEXTI:DATA1,39,40,41,129,167,168,169:FH=10
4 ML=PEEK(40)+256*PEEK(41)+3839:DIMD(8),V%(14,14),DR(9),DC(9)
5 FORI=1TO9:READDR(I),DC(I):NEXTI
6 DATA1,-1,1,0,1,1,0,-1,0,0,0,1,-1,-1,-1,0,-1,1
7 FORI=1TO8:READDC(I):NEXTI:DATA-40,-39,1,41,40,39,-1,-41
8 H=81:C=87:NP$="C":M=0:W=0:PRINT"MICRO GOMOKU":IN$="N"

112 GETF$:IFF$=""THENRETURN
113 IFF$=CHR$(13)THENFB=1:RETURN
114 IFF$<"1"ORF$>"9"THENRETURN
115 QQ=ASC(F$)-48:DX=DC(QQ):DY=DR(QQ):RETURN
```

machine-code part. If you have an 80-column screen, change RL in line 1 to 80, the DATA values in line 3 to 1, 79, 80, 81, 129, 207, 208, 209, and the DATA values in line 9 to -80, -79, 1, 81, 80, 79, -1, -81.

To create a working PET copy of GOMOKU, first load the BASIC part, then load the machine code previously saved by the monitor (it will always be located from \$1300 to \$14AB in the PET version), then issue the command SAVE "PET GOMOKU" to save a copy that combines both parts.

The PET version uses the numeric keyboard to indicate your move. Once the cursor is where you wish to move, just hit RETURN to enter the move.

Acknowledgement

I published an earlier version of PET GOMOKU in the December, 1979 issue of *CURSOR* (Box 550, Goleta, CA 93116). That version benefitted from many improvements suggested by Glen Fisher. To the extent that his suggestions survived to the current VIC/PET version, his help is gratefully acknowledged.

The text for this article was submitted by the author as a WordPro file. The edited file was then transmitted to our Compugraphic through our FOCUS CompuPlus system.

MICRO

SIGNALMAN MARK I DIRECT CONNECT MODEM - \$89.50

Standard 300-baud, full duplex, answer/originate. Powered by long lasting 9-volt battery (not included). Cable and RS-232 connector included.

EPROMS - HIGH QUALITY, NOT JUNK

Use with PET, APPLE, ATARI, SYM, AIM, etc. 450 ns. \$6.50 for 2716, \$12.50 for 2532. We sell EPROM programmers for PET and ATARI

5 1/4 INCH SOFT SECTORED DISKETTES

Highest quality. We use them on our PETs, APPLES, ATARIs, and other computers. \$22.50/10 or \$44.50/20

NEW! C. ITOH STARWRITER F-10 DAISY WHEEL PRINTER

Letter quality, flawless copy at 40 char/sec. Bidirectional printing, 15-inch carriage, uses standard Diablo ribbons and print wheels. ~~IEEE = \$1595~~

PARALLEL - \$1495, RS-232 - \$1680, TRACTORS - \$210

MAE SOFTWARE DEVELOPMENT SYSTEM FOR PET, APPLE, ATARI

"The Compatible Assembler"

- Professional system for development of Machine Language Programs. 31 Characters per label.
- Macro Assembler/Text Editor for Disk-based systems.
- Includes Word Processor for preparation of Manuals, etc.
- Standard Mnemonics - Ex: LDA (LABEL), Y
- Conditional Assembly, Interactive Assembly.
- Editor has string search/search and replace, auto line numbering, move, copy, delete, u/c capability.
- Relocating Loader to relocate object modules.
- Designed with Human Factors Considerations.

\$169.95

FLASH!! EHS Management has decided to allow \$50.00 credit to ASM/TED owners who want to upgrade to MAE. To get this credit, return ASM/TED manual with order for MAE

ATARI AND PET EPROM PROGRAMMER

Programs 2716 and 2532 EPROMs. Includes hardware and software. PET = \$75.00 - ATARI (includes sophisticated machine language monitor) = \$119.95

PET BASIC SCROLL PROGRAM

Scroll thru basic program using Cursor up/down keys. Specify computer. \$6.00 on cassette, \$9.00 on disk.

Flip 'N' File diskette storage case (50-60 disks) - \$21.95

Memory Test for Apple on Disk = \$9.95, on Tape = \$6.95

System Saver for Apple - Fan, Surge Protection, 2 extra outlets, Apple power cord = \$75.00

BMC Green Screen Video Monitor.

12 inch CRT, sharp, crisp 40 or 80 column display. = \$90.00

DC Hayes Smart Modem = \$235.00, Micro Modem II = \$289.00, Chronograph = \$225.00

C. Itoh Prowriter Printer. Better than MX80. We use constantly with our Apple and PET. Can be used on IBM, Atari, TRS-80, etc. 120 cps, friction and tractor feeds, hi resolution dot graphics, nice looking, high quality construction. Parallel - \$499.00, with IEEE interface for commodore - \$599.00, RS232 - \$660.00

Number Shuffle on the Atari

by Frank Roberts

A computer version of the popular game Magic Square.

Number Shuffle
requires:

Atari 400 or 800, 8K

In the days of yore, before Rubik's Cube, there existed a two-dimensional puzzle called Magic Square. It was played by rearranging a random set of numbers within a four-by-four matrix until the numbers were in numerical ascending or descending order.

This program is a computer simulation of that puzzle, and is built around a six-by-six matrix. All positions surrounding the central matrix are set to a value of -1 and used only for comparison and validation of moves. One position of the four-by-four center matrix, set to zero, is graphically represented by a blank space. Only the numbers horizontally or vertically adjacent to the space may be moved into that vacant space.

The game begins after the numbers in the NBR array are shuffled 100 times (lines 210-250) and set into the playfield array, BRD (300-370). Once the board is displayed on the screen, the user is prompted for a choice of numbers to move into the empty space. If the number is valid, the number and the space are switched. The X and Y arrays hold the screen coordinates for each number in the central matrix. The switch is made in lines 530-560 and subroutine 20-25. Lines 600-650 check the board after every switch. If all numbers are in proper ascending order, the program terminates with a congratulations and some fanfare. It will also display the total number of moves made to solve the puzzle. To check for a solution in descending order, just change line 610 to FOR J=29 TO 8.

Note: If you wish to see display of finish without working through the whole puzzle, just type "GOTO 700."

Two Many Lines

Kerry Lourash, author of "Surchange for OSI" in the August issue, noticed an error in his listing. On page 77, there are two line numbers for 1100. Type in only one.

Move the Decimal

An error in the September Software Catalog last month could have bankrupted MicroSoftware International, Inc. *Computer Business Software* was wrongly listed as \$64.70. It should have been \$6470.00. Pardon our slip.

OSI Delete Modifications

Claude Barron of Quebec, Canada, sent in this update.

In the August issue of MICRO, Morris and Morishita wrote a program for "Delete on the OSI." Here is a modification that will save you seven bytes in your program.

In their program to get the code for the "OK", you go through the output to CRT routine, and then get back to BASIC in address \$A319. Another way would simply get you back in BASIC through the warm start located at \$A274. This routine will print the "OK". Here are the necessary changes in your BASIC program:

```

18 N=57:FOR X=M TO M+N-1:
  READ J:POKE X,J:NEXT
22 A=INT(M/256):B=M-256*A:
  POKE M-6,A:POKE M-7,B
42 DATA 144,5,32,110,2,240,219,
  76,116,162

```

There is no need for a line 44.

I would also like to point out a little mistake in the text. When you write that the code is relocatable with the exception of the JSR at \$026E, it should be \$0266.

MICRO™

VOICE I/O THAT WORKS!

for the APPLE II and Commodore computers

Voice I/O has come a long way from the barely intelligible computer speech of only a few years ago. It is now possible to enter data or commands to your computer just by talking to it and the computer can talk back with clear, pleasant, human sounding voice.

The COGNIVOX models VIO-1002 (for Commodore) and VIO 1003 (for the Apple II+) are at the forefront of a new generation of Voice I/O peripherals that are easy to use, offer excellent performance and are affordably priced.

SOME SPECIFICATIONS

COGNIVOX can be trained to recognize up to 32 words or phrases chosen by the user. To train COGNIVOX to recognize a new word, you simply repeat the word three times under the prompting of the system.

COGNIVOX will also speak with a vocabulary of 32 words or phrases chosen by the user. This vocabulary is independent of the recognition vocabulary, so a dialog with the computer is possible. Memory requirements for voice response are approximately 700 bytes per word.

For applications requiring more than 32 words, you can have two or more vocabularies and switch back and forth between them. Vocabularies can also be stored on disk.

HOW IT WORKS

COGNIVOX uses a unique single-chip signal processor and an exclusive non-linear pattern matching algorithm to do speech recognition. This gives reliable operation at low cost. In fact, the performance of COGNIVOX in speech recognition is equal or better to units costing many times as much.

For voice output, COGNIVOX digitizes and stores the voice of the user, using a data compression algorithm. This method offers four major advantages: First there are no restrictions to the words COGNIVOX can say. If a human can say it, COGNIVOX will say it too. Second, it is very easy to program your favorite words. Just say them in the microphone. Third, you have a choice of voices: male, female, child, foreign. Fourth and foremost, COGNIVOX sounds very, very good. Nothing in the market today can even come close to the quality of COGNIVOX speech output. You can verify this yourself by calling us and asking to hear a COGNIVOX demo over the phone. Hearing is believing.

A COMPLETE SYSTEM

COGNIVOX comes assembled and tested and it includes microphone, software, power supply, built in speaker/amplifier and extensive user manual. All you need to get COGNIVOX up and running is to plug it in and load one of the programs supplied.

It is easy to write your own talking and listening programs too. A single statement in BASIC is all that you need to say or recognize a word. Full instructions on how to do it are given in the manual.

COGNIVOX model VIO-1002 will work with all Commodore computers with at least 16k of RAM. Model VIO-1003 requires a 48k APPLE II+ with 1 disk drive and DOS 3.3.

ORDER YOUR COGNIVOX NOW

Call us at (805) 685-1854 between 9am and 4pm PST and charge your COGNIVOX to your credit card or order COD. Or send us a check in the mail, specifying your computer. Price for either model of COGNIVOX is \$295 plus \$4 shipping in the U.S. (foreign add 10% we ship AIR MAIL).

Sensible Use of Apple Game Paddles

by Harry L. Pruetz

Some programming suggestions to improve the validity of game-paddle inputs.

Paddle Use

requires:

Apple computer with either Integer or Applesoft BASIC and the Apple game paddles

When using Apple II game paddles, there are both hardware and software problems involved. With some knowledge of inherent limitations, the paddles can add to the enjoyment of computer games, both while designing a game and playing it.

My Apple II came with two paddles hooked up to the game I/O connector. The paddles were actually rotating potentiometers, rather than the joystick-type paddles available. Unlike two-player games, games designed for one player using both paddles for x-y control would be better played with a real joystick controlling both x and y coordinate movements.

The most obvious limitation on both game paddles is the 300-degree physical limit on control knob movement. Numerical values possible from a paddle range from 0 at the complete counter-clockwise position, up to 255 at the complete clockwise position. However, these values are available for only about a 150-degree rotation of the knob.

The values read from BASIC using the PDL function may be expressed as a function of the angle of the paddle knob as follows:

Angle	Value
0-29	—
30-65	0
66-101	0-63
102-137	64-127
138-173	128-191
174-209	192-255
210-329	255
330-359	—

The value read from a paddle may change by 1 when the knob is moved slightly

more than half of a degree! Labeling the paddles and marking the actual ranges are quite helpful for many games.

The paddle cable that plugs into the game I/O connector is a source of problems. Each time the paddles are disconnected, cable pins may get bent when reconnecting the paddles. The pins may be bent back into shape and the electrical connection will still be sound. However, a simple program to sample and display paddle values should be run occasionally to make sure the paddles are functioning correctly.

A monitor routine measures a paddle value by delaying 12 microseconds for each unit value measured after the paddle is triggered. Thus a value of 255 takes three milliseconds to measure. Times of one to three milliseconds for each PDL call are not excessive for Integer or Applesoft BASIC. There are usually many other statements executed between PDL calls. Compiled

BASIC or faster computer languages may still use the paddles for game input without noticeable effect from the slow timing speed. It is usually the machine-language implementations of sophisticated, fast-action games that avoid using paddles.

The program listed is a RAM Applesoft BASIC program to test and demonstrate some software techniques useful with game paddles.

Lines 100 through 195 merely sample paddle 0 and print a value if it is different from the previous sample. Line 110 exits the sampling loop when any key is pushed. The paddle may be set to any value greater than 0 and less than 255, and left untouched for a while. Because of the sensitivity of the pot and the monitor routine which determines the value PDL(0), the value often skips back and forth between two consecutive numbers. This causes errors in some games that are not the player's

fault. When the paddle cable is not properly plugged into the game I/O connector, values may vary even more, sometimes changing when the other paddle is moved.

Lines 200 through 295 provide a more stable readout from paddle 1. A different paddle is used here to allow the program to be used for paddle checkout. When paddle 1 is not being moved, the averaged value VC changes only in very rare cases. A disadvantage of this averaging method is that the range is now only 0 through 254. Averaging also slows down the rapidity with which VC may change. Paddle 0 in the first case can be moved from one extreme to the other during only three or four samplings. Paddle 1 in this case takes about five more samplings for VC to catch up to the actual PDL(1) value. Line 215 could also be changed to give the previous value more weight with the penalty of slowing down the sampling even more. For example:

215 VC = INT(INT(PDL(1) + 2*VP)/3)

The INT functions required in Applesoft BASIC make the above statement more inefficient than when using Integer BASIC.

Lines 300 through 395 use high-resolution graphics to demonstrate paddle sampling with averaging. XC% and YC% are arrays used as circular queues to allow display of the last 128 locations of the 'X' shape. The functions at lines 40 and 45 convert a paddle value into x and y coordinates. Again, INT functions are required in Applesoft BASIC to insure integer arithmetic. The numbers in the defined functions are fairly easy to obtain by using the "slope-intercept form" for straight lines. From Analytic Geometry:

$$f = a + mg,$$

where g is the independent variable, m is the slope of the line, a is the value of f at g = 0, and f is the dependent variable.

We want the paddles to determine screen location. Only multiples of 4 are used as x-coordinate locations, so the figure 'X' may be plotted at 4, 8, ..., and 276 without x-3 or x+3 causing "illegal quantity" errors. Ignoring the multiplier of 4 for now, f should be 1 when PDL(0)=0, and 69 when PDL(0)=255. For $f = a + m \cdot \text{PDL}(0)$, $a = 1$ and $m = (69 - 1) / (255 - 0)$, so that $f = 1 + (\text{PDL}(0) \cdot 68) / 255$ and $x = 4 \cdot f$. Thus we get line 40, where D is an unused dummy variable:

```

40 DEF FN X(D) = 4*INT(1 + INT
(PDL(0)*68)/255)

```

Multiples of 2 are used as y-coordinate locations, so the figure 'X' may be plotted at 4, 6, ..., and 188

without $y-3$ or $y+3$ causing "illegal quantity" errors. Ignoring the multiplier of 2 for now, f should be 2 when $PDL(1)=0$, and 94 when $PDL(1)=255$. For $f = a+m \cdot PDL(1)$, $a=2$, $m=(94-2)/(255-0)$, and $y = 2 \cdot f$. Thus we get line 45, where D is an unused dummy variable:

```
45 DEF FN Y(D) = 2*INT(2+INT
(PDL(1)*92)/255)
```

Line 320 initializes the circular queue. The actual loop is lines 330 through 375. The loop performs the following steps:

1. Erase current 'X'.
2. Erase last point in trail.
3. Plot current point in trail.
4. Save point location in queue.
5. Adjust queue pointer.
6. Plot next 'X'.

Lines 360 and 365 average the x and y values obtained from the paddle functions. The averaging has a smoothing effect on movements of the figure 'X' as it is moved around on the high-resolution grid.

Lines 400 through 495 demonstrate a way of obtaining reliable paddle input without averaging. The routine at line 50 is essentially the same as the one at line 60. However, the $PDL(0)$ routine will be explained in detail. Let us consider the case of $PDL(0)=0$ and $XP=0$.

If $PDL(0)$ is increased to 4, then XP becomes 1. If $PDL(0)$ changes back to 3 by itself, there will be no new XP because the difference is only 1. Now, when $PDL(0)$ is increased to 7, there will still be no change in XP . If $PDL(0)$ changes to 8 by itself and then back to 7 again, the value $XP=2$ will be calculated and will remain in effect until $PDL(0)$ is changed to 4 or 12. Thus the output of this routine is stable without averaging. I have chosen to call the method differencing. Note that merely dividing $PDL(0)$ by 4 would not give stable results. The use of $SGN(D) \cdot INT(ABS(D))$ is used since $INT(-1.1)$ gives -2 instead of the -1 desired.

Note also that $255-PDL(1)$ is used in line 65 rather than just $PDL(1)$. This gives the same "intuitive" coordinate change for the y -coordinate as paddle 0 does for x -coordinate values. Thus, clockwise rotation of paddle 1 causes movement from the bottom to the top of the CRT display.

The rest of this case is essentially the same as lines 300 through 395.

Finally, we have a demonstration in lines 500 through 595 of fractional ranges of the paddles. The routines that sample the paddles are at lines 70 and 80. The fraction involved is $255/45$ or 5.66667 . This gives a high-resolution display of 46 by 46 cells six points wide and four points deep. Only 276 of 280

horizontal, and 184 of 192 vertical high-resolution points are used. The white cursor is plotted and erased using the complimentary color between the background lines. Straight black lines are drawn between each position of the cursor as it is moved using the game paddles.

Fractions much smaller than 5.66667 may be used in the difference calculations for game paddles. I have used a fraction as small as 1.275 to get 200 stable values from a game paddle. The values are not exactly "one-to-one" for a game paddle. For example, $PDL(0)=7$ may give a calculated value of 5 or 6 depending on the previous value. However, the calculated values are stable and the game player cannot see the difference.

If you have Integer or Applesoft BASIC programs that use game paddles and do not give satisfactory results, you may consider making a few simple changes similar to the given examples. Programs that use only a few keys may also be changed to use the game paddles. Above all, sit back and relax. An aching back caused by leaning over a keyboard is not really necessary.

Convert almost any static memory OSI machine to CP/M® with the D & N-80 CPU Board.

Z80A CPU with 4MHz clock. 2716 EPROM with monitor and bootstrap loader. RS-232 serial interface for terminal communications or use as a serial printer interface in a VIDEO system. Disk controller is an Intel 8272 chip to provide single or double density disk format. 243K single density or 608K double density of disk storage on a single sided 8" drive. A double sided drive provides 1.2 meg of storage. DMA used with disk controller to unload CPU during block transfers from the disk drives. Optional Centronics type parallel printer port com-

plete with 10 ft. cable. Optional Real Time Calendar Clock may be set or read using 'CALL' function in high level languages. Power requirements are only 5 volts at 1.4 amps. Available with WORDSTAR for serial terminal systems.

INCLUDES CP/M 2.2

D & N-80 serial	\$695
D & N-80 serial w/Wordstar	\$870
D & N-80 video	\$695
Option 001	\$ 80

parallel printer and real time calendar clock

D & N-80 CPU BOARD

OTHER OSI COMPATIBLE HARDWARE

IO-CA10X Serial Printer Port \$125
Compatible with OS-65U and OS-65D software

IO-CA9 Parallel Printer Port \$175
Centronics standard parallel printer interface with 10 ft. flat cable

BP-580 8 Slot Backplane \$ 47
Assembled 8 slot backplane for OSI 48 pin buss

24MEM-CM9 \$380 **24MEM-CM9F** \$530
16MEM-CM9 \$300 **16MEM-CM9F** \$450
8MEM-CM9 \$210 **8MEM-CM9F** \$360
BMEM-CM9F \$ 50 **FL470** \$180
24K memory/floppy controller card supports up to 24K of 2114 memory chips and an OSI type floppy disk controller. Available fully assembled and tested with 8, 16, or 24K of memory, with floppy controller (F). Controller supports 2 drives. Needs separated clock and data inputs. Available Bare (BMEM-CM9F) or controller only (FL-470). Ideal way to upgrade cassette based system

C1P-EXP Expansion Interface \$ 65
Expansion for C1P 600 or 610 board to the OSI 48 pin buss. Requires one slot in backplane. Use with BP-580 backplane

BIO-1600 Bare IO card \$ 50
Supports 8K of memory, 2 16 bit parallel ports may be used as printer interfaces. 5 RS-232 serial ports, with manual and Molex connectors

DSK-SW Disk Switch \$ 29
Extends life of drive and media. Shuts off minifloppy spindle motor when system is not accessing the drive. Complete KIT and manual

D & N Micro Products, Inc.

3684 N. Wells St.
Fort Wayne, Ind. 46808
(219) 485-6414

TERMS \$2.50 shipping, Foreign orders add 15%.
Indiana residents add 4% sales tax.

Disk Drives and Cables

8" Shugart SA801 single sided \$395
8" Shugart SA851 double sided \$585
FLC-66ft. cable from D & N or OSI \$ 89
controller to 8" disk drive

5 1/4" MPI B51 with cable, power \$450
supply and cabinet

FLC-5 1/4 ft. cable for connection \$ 75
to 5 1/4 drive and D & N or OSI controller, with data separator and disk switch

16" paper width, 132/232 columns with tractor feed

ML 84 Same as 82A except 200 CPS, \$1152
16" paper width, 132/232 columns, 2K buffer, dot addressable graphics, with tractor feed

Space Invasion for OSI C1P/Superboard

by John S. Seybold

Space Invasion requires:

OSI C1P or Superboard

In this real-time arcade game you must fight waves of incoming aliens. Each time you clear the screen of aliens it refills with more aliens, faster and closer than the last bunch. The more times you clear the screen, the more points each alien is worth.

The aliens are moved by the user routine; their addresses are updated in line 2510. Z tells the routine which way to move the aliens. To adjust the pace of the game, you may adjust line 2082 or line 2520. If you remove all of the REM statements, the program should run in 4K of memory.

Mr. Seybold is employed by General Dynamics in Pomona, CA. He has owned an OSI Superboard for a year and a half. Address correspondence to 3210 Quartz Lane, #A-10, Fullerton, CA 92631.

**Northeast
Computer Show**

Nov. 11-14, 1982

Hynes Auditorium
Boston, Massachusetts

Booth #406

We look forward to meeting you!**VANTEC 80**

The COMPLETE 80 COLUMN VIDEO Board
with HIGH RESOLUTION GRAPHICS
CAPABILITY for your APPLE.

At last... a complete video board for your Apple II or Apple II+ microcomputer. No longer are "Soft Switches, Lower case Eproms" and low quality graphics necessary. By mixing the 80 column video directly onto the normal video output, either high resolution graphics, low resolution graphics or 40 column text may be combined with the 80 column display.

Save \$90 on Introductory Special.... (List \$389).... **\$299***

RC Electronics Inc.

7265 Tuolumne Drive, Goleta, CA 93117
(805) 968-6614

Dealer Inquiries Invited

- The VANTEC 80 is the only board that can overlay an 80 character display on the normal Apple video.
- Software switching between 80 & 40 character displays.
- Mix High Res or Lo Res graphics with the 80 character text display.
- Upper and lower case characters with shift mod provided.
- Flashing or inverted block video cursor.
- Apple-soft, Apple Pascal and Z80 Softcard® compatible.

*Special Introductory Pricing available for systems purchased before Nov. 30, 1982. Credit card orders add 3%. California orders add 6% sales tax.

Apple Shutdown

by Eric Grammer

A type and RUN low-resolution graphics game.

Shoot Down

requires:

Apple II with Applesoft and game paddles

Here is a simple game with a short machine-language sound program. The object of the game is to shoot at all the columns with dots in them. The dots will fire back at you. To move your ship, use paddle (0). To fire, press the button.

The machine-language section should be BSAVED with A\$300, L\$30. The lo-res graphics listing is straightforward and is fairly self-explanatory. Good shooting!

Skyles Electric Works Presents

The VicTree™

...Leaves your new Vic (or CBM 64) with 35 additional commands.

...Branches out to most BASIC 4.0 programs.

...Roots into most printers.

New from Skyles: the VicTree, a coordinated hardware and software package that allows your Vic to branch out in unbelievable directions and makes it easier than ever to do BASIC programming, debugging and to access your disk. And the new VicTree provides routines to interface the Vic to the powerful ProNet local network. 8kb of ROM — 4kb for the BASIC commands, 4kb for disk commands and interfacing to ProNet — plus 4kb of RAM for miscellaneous storage. Perfect not only for the new Vic but also for the Commodore 64. Unbelievably simple to use and to install, the VicTree gives you all the additional BASIC 4.0 commands to allow most BASIC 4.0 programs to work on your new Vic or CBM 64.

Now only \$89.95...or \$99.95 complete with Centronics standard printer cable. (Cable alone \$19.95.) Available now from your local dealer or order through your Visa or MasterCard toll free (800) 227-9998 (California, Canada, Alaska, Hawaii: (415) 965-1735) or send check or money order directly to:

What to Do with 96K — Two Word Processor Approaches

For the designers of Wordcraft Ultra and WordPro 5 Plus, it must have been a pleasant dilemma. Steve Punter and Pro-Micro Software had their popular WordPro 4 Plus to upgrade, while P.L. Dowson and DataView had the sleek Wordcraft 80 to work with. It is only logical that the extra memory provide more room for text, but it is what else has been added to the programs that makes them so interesting.

This column is devoted to a discussion of these two word-processing programs for the CBM 8096. Because these versions retain all the features of their predecessors, my discussion should be of use to people with 8032s, as well as to those with 8096s. A future PET Vet column will cover word processors for the 40-column PETs.

Wordcraft Ultra will run on an 8096, an 8032, or an 8032 expanded with Madison Computer's ZRAM board. WordPro 5 Plus is designed specifically for the 8096; it will not work with the 8032. Wordcraft versions require a special "data key" (formerly known as a "dongle"), while WordPro versions require a functional ROM in the \$A000 socket.

I will start with a general discussion of the two word processor families. Except where otherwise noted, Wordcraft refers to all the Ultra configurations and Wordcraft 80, while WordPro refers to WordPro 4 Plus and WordPro 5 Plus. I will also discuss the extra enhancements in the new versions.

The "Flavor" of WordPro

WordPro essentially presents you with a continuous scroll of 80-character lines on which to type. You start in the upper left-hand corner and keep typing until you're done. Words get split, but (not to worry) they will be kept together at output time. This, coupled with there being only two status lines, allows a lot of text to be viewed at once. Margins, centering, justification, paging, line spacing, and several other features are handled at output time. These are specified in the text

on special, non-printing format lines.

If you're working with elaborate tables or a particularly fancy text, the continuous nature of the text and the distracting format lines make it difficult to visualize what the result will look like. There is a special output-to-video command that will show you the results on the screen, without wasting paper, but editing must still be done on the original, continuous version, and this is time consuming.

WordPro has a special feature called "Extra Text," which may be used to hold other text files, disk directories, commonly used phrases and paragraphs, or files of names and addresses for filling form letters. In WordPro 5 Plus there are four such extra text areas. WordPro 3 and 4 have only one, but the relative sizes of the extra and main text areas can be apportioned differently for different needs. I used WordPro 5 Plus to write this column, primarily because of the "append characters" function. I stashed the names WordPro, WordPro 5 Plus, Wordcraft, and Wordcraft Ultra in extra memory, so that with only a few keystrokes I could copy those characters at the current cursor position. Whole paragraphs are handled in a similar manner. The extra text also makes it possible to have a whole file of names and addresses in memory at the same time as the target form letter.

The "Flavor" of Wordcraft

If you've used a big, dedicated word processor, you will be more comfortable with Wordcraft. With a few exceptions, what you see on the screen is what you get on paper. You can tell how lines will look before they are printed. Even documents wider than 80 columns can be handled. The screen is a window that can be panned across the text. If a really long word has been moved to the next line, leaving the previous one too short, you can easily tell where to insert a soft hyphen to even up the line lengths. Most format commands are indicated by the presence of reverse field on a text character, but they don't take up space on the screen. Instead of giving you a continuous scroll of lines, Wordcraft gives you a certain number of characters to work with. It forces new pages as needed according to your page-length specifications.

One powerful feature of Wordcraft is the ruler, which indicates the positions of your margins and tab stops. Its current contents are shown on the bottom status line (of five). The ruler may be changed at any time. If you're trying to get a table to look just right, you can try out one arrangement of tab stops, type in your text with tab characters at the right points, and then go back and readjust your ruler without reentering the text or the tab characters. The text will automatically line up at the new tab stops as soon as you finish changing the ruler.

A Comparison of WordPro and Wordcraft

Now that I have discussed the special features of Wordcraft and WordPro, I can compare them on what they have in common. Most word processors perform the following functions in some way. Some do them better than others.

Entry of Text: Both programs do a good job here. You can continue typing without worrying about the way words carry over to the next line. WordPro uses a simple carriage return to force a new line and the tab key to advance to the next tab stop. With Wordcraft, these must be preceded by the control key. The Commodore business keyboard, with its full cursor control, is well-suited to word processing.

Editing of Text: Both WordPro and Wordcraft have commands for deleting, inserting, transferring, and duplicating text. In general, Wordcraft's commands are more powerful, making cut-and-paste operations very easy. WordPro's delete, transfer, and duplicate commands have restrictions, which can be circumvented by inserting and deleting spaces. Insert mode with WordPro is more convenient.

Search and Search-and-Replace: Neither program excels at these functions. WordPro's command structure is complicated. The search-and-replace command is an all-or-nothing proposition. The search command finds the next occurrence of the search string, but requires a different command sequence to continue searching for the same string. Both commands can act globally or just on the current file, and there is an option to ignore case. Wordcraft's commands make more sense, but

PET Vet (continued)

there is no global option and delimiters (an artifact from line editors) are required around the search string. Both programs use the '?' as a "wild" character.

File Maintenance: WordPro makes this easy. It is possible to recall files using a few characters and an asterisk (the same as with other PET files). Also, file names can be read directly from the text area of the screen, such as from a comment line or directory listing. It is also possible to get a selective directory listing. When you have specified a file name that already exists, WordPro asks you if you want to replace it. Wordcraft, with its chapter organization and optional descriptive names and dates, makes documentation of the contents of a disk much more complete. However, saving and loading files is more cumbersome. Full file names must be typed in.

Support of Printers: WordPro fully supports a limited number of printers. It was designed specifically with the NEC Spinwriters in mind, and the combination works very well. The Diablo 630, Qume Sprint 5, CBM 8027, TEC 1500, and dot matrix types, are supported as well. However, other printers may not be fully supported. Wordcraft comes with a long list of printer data files, each matched to a particular printer/print wheel combination, on

the master disk. The Wordcraft dealer can obtain a PDF from the distributor for just about any printer that runs off the IEEE. Wordcraft Ultra has special features for supporting printers with proportional spacing print wheels.

Generation of Form Letters: Wordcraft's handling of these is more powerful. The fields in the letter have unique identifiers, so that the same piece of information from the fill file may be reused. This avoids a lot of extra typing when you construct the fill file. However, the fill file must be used from the disk, and while entries may be used selectively, it is difficult to remember which page numbers go with which entries in the file. This makes editing difficult. WordPro, with its extra memory feature, allows the fill file and the form letter to be in memory at the same time, making editing much easier. Blanks in the form letter are filled sequentially, so if the same item has to be reused in the letter it must appear twice in the fill file. Selective use of entries from the fill file is also more difficult.

Handling of Long Files: WordPro has a chaining feature that allows a document to extend beyond the capacity of the computer. Print, search, search-and-replace, copy, and output-to-video commands can all be specified with global options. A global command will operate not only on the file in

memory, but also on all the files linked to it and stored on disk.

Wordcraft, instead of chaining files, uses a "chapter" organization. To continue a file, save the first as chapter 1, then assign the continuation to chapter 2 of the same file. Files may be printed out globally, or by specifying a certain range of chapter numbers. Also, individual pages may be selected. However, commands such as search, search-and-replace, and copy act only on the chapter in memory.

What's Been Added?

Wordcraft's text size has been approximately doubled, from about 11,000 characters in Wordcraft 80 to over 20,000 in Wordcraft Ultra. Wordcraft 80 requires the master disk to be present in one drive, since the editor and print module could not reside in memory at the same time. With Wordcraft Ultra the entire program resides in memory at one time, leaving both drives available for file operations. (The 8032 configuration requires a ROM, which contains program modules.) Wordcraft Ultra adds a set of escape codes that provide such capabilities as selective double-spacing and centering or right alignment of a series of lines. Other escape codes handle

PET Vet (continued)

pitch, vertical spacing, horizontal spacing, and proportional spacing. Unfortunately, these non-printing characters occupy space on the screen, making it a less accurate representation of what will be printed. Also added is support of Canadian Micro Distributing's MUPET multiple-user system. Wordcraft Ultra also has its own built-in multiple user system. Another big improvement is the provision to handle proportional spacing print wheels. The price of Wordcraft 80 is \$395, while that of Wordcraft Ultra is \$545.

WordPro 5 Plus includes the main and four extra text areas, each containing 169 80-character lines. Therefore, the maximum length of a single file in memory has not increased from WordPro 4 Plus to WordPro 5 Plus, but then neither has the price (both \$450). WordPro 5 Plus has added support of the MUPET system, as well. I have just barely begun to explore the possible uses of the extra text areas.

Conclusions

With the possible exception of the IBM PC, the CBM 8032/8096 has the best keyboard for microcomputer business applications. Easy cursor control, built-in screen editing, and the separate numeric keypad all con-

tribute. Dedicated word processors have many special keys on the keyboard for all the things a word processor has to do. A microcomputer keyboard has to be used for applications besides word processing, so it can't afford the luxury of all the extra keys. Both programs take advantage of what the computer has to offer.

Overall, I rate Wordcraft as a more powerful word processor. However, WordPro is much easier to learn. If you don't use Wordcraft every day, you will find yourself frequently looking things up, even if you learned it thoroughly the first time around. Beyond that, it really depends on what you want to do. If you plan to do a lot of "boiler-plate" (putting a document together using standard phrases and paragraphs) then you will find WordPro easier to use. If you're working on a really long document, such as a book, then the chapter organization of Wordcraft will be handy. For full control of a variety of letter-quality printers, for tabular material, and for material wider than 80 columns, Wordcraft has the edge. A big point in WordPro's favor is that it is (in its many versions) already the most popular word processor on the market for Commodore systems. This means that it is easier to exchange files with other people and that commercial programs, such as spelling checkers and

data-base managers, will be written for WordPro first.

When you consider word processors for the 8096 you shouldn't forget Silicon Office — a combination word processor, data-base manager, and communications package. Contributing Editor Jim Strasma covered it in a full-length review in MICRO's June issue. He was particularly impressed with the word processor portion. It can handle long files much better (the whole disk!), can handle multiple-column documents, and can perform calculations using information from the data base. The \$995 price is out of the range of the word processors covered here, but if you need a data-base manager, too, be sure to give Silicon Office a lot of consideration.

WordPro is distributed to dealers by Professional Software, Inc., 51 Fremont Street, Needham, MA 02194. Wordcraft 80 and Wordcraft Ultra are distributed to dealers by Computer Marketing Services, Inc., 300 W. Marlton Pike, Suite 26, Cherry Hill, NJ 08002.

Special thanks to Jim Lucivero of NEECO in Needham, MA, for the use of letter-quality printers used in this review.

OSI Disk Users

**Double your disk storage capacity
Without adding disk drives**

Now you can more than double your usable floppy disk storage capacity—for a fraction of the cost of additional disk drives. Modular Systems' DiskDoubler™ is a double-density adapter that doubles the storage capacity of each disk track. The DiskDoubler plugs directly into an OSI disk interface board. No changes to hardware or software are required.

The DiskDoubler increases total disk space under OS-65U to 550K; under OS-65D to 473K for 8-inch floppies, to 163K for mini-floppies. With the DiskDoubler, each drive does the work of two. You can have more and larger programs, related files, and disk utilities on the same disk—for easier operation without constant disk changes.

Your OSI system is an investment in computing power. Get the full value from the disk hardware and software that you already own. Just write to us, and we'll send you the full story on the DiskDoubler, along with the rest of our growing family of products for OSI disk systems.

™DiskDoubler is a trademark of Modular Systems.

Now . . . The Ultimate In Wordprocessing For The Commodore Computer. **WORDCRAFT ULTRA!**

Wordcraft ULTRA™ turns your Commodore microcomputer into one of the world's most advanced word processing systems, incorporating features previously found only in systems priced thousands of dollars higher!

- True proportional spacing with inter-character and inter-word spacing!
- Multi-user with up to 8 CPU's sharing one or more disk drives and printers with no extra hardware required other than a cable!
- Screen layout matches the printed document! You'll love the "what you see is what you get" feeling.
- Continuous centering, delete and insert, movement of text, search and replace, tab and indent, bold print and underline . . . a seemingly endless list of features designed to make text editing as simple and complete as possible!
- Wordcraft ULTRA runs on the CBM 8032, 8096 or Madison Computer's Z-RAM™ board. The Z-RAM Board not only expands your computer to 96K but also adds CP/M™.

Why settle for less when you get so much more with Wordcraft ULTRA on the Commodore Computer!

Apple Hi-Res Graphics and Memory Use

by Dan Weston

This article examines the conflicts of programs and hi-res graphics on the Apple II, plus several techniques to avoid these conflicts.

Hi-Res
requires:
Apple II with 32K

When you begin to write long programs that use the hi-res pages of the Apple II, you will overwrite the graphic display area if your program and variables are longer than 6K. There are many ways to get around this problem, which involve manipulating the pointers Applesoft uses to control memory usage. Here I discuss several methods for making the most of your computer's memory.

Normally a BASIC program is loaded beginning at memory location \$800 [2048]. The program fills memory upwards from \$800. LOMEM is set to the end of the program and will change as the program changes.

Simple variables are stored from LOMEM upward as they are defined by the program. Arrays are stored from the end of simple variables upward. An addition to the simple variable space will push the array variables upward with no loss of integrity. Finally, string variables are stored from the top of available memory, HIMEM, downward in memory, with new strings being placed in successively lower memory locations. The pointers that guide the placement of variables are summarized in figure 1, and will be discussed later in this article.

The problem with this storage scheme is that the hi-res pages are located between the program and the

end of memory. Hi-res page 1 display area sits between \$2000 and \$4000 [16384-24575], and hi-res page 2 sits from \$4000 to \$6000 [24576-32758]. There is a 6K block of memory between \$800 and the beginning of hi-res page 1. If your program is longer than 6K and invokes HGR, you will find that the last portion of your program has been wiped from memory. Even with programs shorter than 6K, an HGR call can wipe out arrays and variables that are stored above the program.

To avoid this problem, set LOMEM

at the upper end of the hi-res page (1 or 2), so that simple variables and arrays will be stored above the hi-res area rather than across it. This method requires that the program be less than 6K, and that the LOMEM statement come before any variables are defined. LOMEM: 16384 will store variables above hi-res page 1. LOMEM: 24576 will store variables above hi-res page 2.

Another method is to put graphics on hi-res page 2 instead of page 1. This frees the 8K bytes of the first hi-res page for program and variable storage, giving

```

you an effective program space of 14K, instead of the 6K you would have if you used page 1. To use page 2, just use HGR2 instead of HGR.

But there are some problems with this method. First of all, you cannot use the four lines of text below the graphics screen with HGR2. This will not be a problem if you are using some sort of hi-res character generator like the DOS TOOL KIT's HRCG. The other problem is that you may want to use both of the hi-res pages, say for page-flipping. In this case you would be back to the original 6K limitation.

The next method that might be useful is to relocate the program above the hi-res page (or pages). This is done by POKEing values into the memory locations that Applesoft looks at to see where to LOAD or RUN a new program. These POKES must be done before the program is loaded or run, say from a "hello" program. Here are the POKES:

to load above page 1

```

POKE 103,1
POKE 104,64
POKE 16384,0 : REM A 0 MUST BE
                PLACED IN MEMORY
                JUST AHEAD OF WHERE
                THE PROGRAM WILL
                LOAD

```

to load above page 2

```

POKE 103,1
POKE 104,96
POKE 24576,0

```

If the program is loaded above page 1 you will have about 22K (in a 48K system) for the program and variables. If you load above page 2, you will have about 14K. The 6K of memory below page 1 (\$800-\$2000) will remain unused by Applesoft.

Once you have loaded your program above a hi-res page you will probably want to figure out some way to use the memory that is just sitting empty below page 1. Again, there are several

options. Here are just a few:

1. You can locate shape tables, especially long tables that will not fit at location \$300, below the hi-res page, beginning at \$800. The table can either be POKEd into that memory range or BLOADED at \$800. Then the pointers at 232 and 233, which tell Applesoft the location of the current shape table, should be POKEd to point to this location. You could put several tables below page 1 and change the pointers as the program used one or another of the tables.
2. The DOS TOOL KIT's high-resolution character generator (HRCG) can be forced to load below page 1 by modifying to LOADHRCG program from the TOOL KIT. Insert the statement 'HIMEM: 8190' in the LOADHRCG program just before the step that says 'PRINT CHR\$(4); "BLOAD RBOOT"'. RBOOT uses HIMEM to determine where to load the character generator. By giving a value of 8190 for HIMEM, the program is fooled into putting the character generator below page 1, rather than at the top of memory. You must insert one more step in the LOADHRCG program: 'HIMEM: 38400' is needed to reset HIMEM to the top of memory, just below the DOS buffers. This step should come after the step that reads 'CALL ADRS: REM INITIALIZE HRCG'. The value you use to reset HIMEM will depend on the size of your system; the value given is for a 48K Apple. Check the DOS manual for the figures for other size systems.
3. If you are writing a very large program that uses lots of variables, especially arrays, you may find that the variables will overwrite the strings, or *vice versa*, and then you have problems. Applesoft uses a set of pointers that tell the program where to store variables as they are encountered. If you change the pointers you can fool the program into using the memory below page 1 for variable storage, thus freeing room at the top of memory for your program.

See the chart in figure 1 for a more complete description of the pointers. Here are the POKES that will cause a program loaded above the hi-res area to place its variables in the memory between \$800 and \$2000. Note: *These POKES must be done before any variables are used by the program.*

```
POKE 115,0
POKE 116,32 : REM HIMEM AT $2000
```

These values are adjusted dynamically by Applesoft as variables are encountered. This is why many of the pointers are set to the same value initially. You may want to set the pointers differently to allow room below hi-res page 1 for some of the shape tables or routines that were discussed in the first part of the article. Play around with the values until you can use as much of the Apple's memory as possible.

Listing 1 tests the use of these pointers. The program must be loaded above one of the hi-res pages, as discussed earlier. The program displays the pointer values before any manipulation, after they are lowered, and finally after a selection of variables is defined by the program. Listing 2 is the output of this program. It shows how the variable pointers are high, above the program, then shift low, below hi-res page 1, then adjust with the definition of variables.

Once these values are set this way, attempts to add lines to the program will result in an "OUT OF MEMORY" error, because HIMEM is lower than the end of the program. Otherwise, the program should run normally and the memory manipulations will be transparent to the user.

I cannot hope to have covered all the tricks that can be used to get the most out of your Apple, but I hope that the ideas I have put forward will allow you to do some exploring and manipulating on your own.

Atari Character Graphics from BASIC, Part 2

by Paul Swanson

The author adds fine scrolling to his character animation program, and introduces programming ANTIC's display list.

Character Graphics II requires:

Atari 400/800

Last month (53:84) I showed you a very simple method for using a custom character set in BASIC. The amount of memory saved by using character graphics instead of map-mode graphics is substantial. A mode 7 screen would normally use almost 4K of memory. Replacing it with character graphics requires ½K for the character set plus about 240 bytes for the 20 × 12 character screen, for a total of about 770 bytes.

Of course, character graphics does have its drawbacks. For example, how do you move an image across the screen without having it "jump" from one character position to the next? The normal ways to put characters on the screen don't offer many alternatives. You could invent additional characters to mimic the movements. All that involves a lot of programming and many characters for each figure on the screen.

Are character-graphics screens dedicated to only those applications where nothing on the screen moves unless you introduce a player or missile? Are they just to display a pretty background for your program?

ANTIC

Fortunately, you have an Atari computer. The Atari has not one, but two microprocessors you can program. The Atari has one processor, a 6502, which functions as the "brain" of the system. It has another, called ANTIC, that controls just the screen display.

ANTIC's language is a machine language, which means it is all numbers, but the language is easy to learn because there are only a few instruc-

tions. Its program is called a display list. Each instruction does something on the screen taken in order from the top of the screen to the bottom.

ANTIC's program usually starts with "blank 8 lines" instructions, using three of them so that the displayed images are all visible on the screen. Televisions are set up with "overscan," which means that part of the actual picture is off the screen in all four directions so that the movies and commercials won't have borders around them. On the computer, you usually want to see the whole screen, so the borders are not so annoying.

Once you have the blank lines out of the way, you need an instruction called a Load Memory Scan (LMS) instruction, which tells ANTIC where the next line is in memory that you want displayed. This command is three bytes long. The first byte is the LMS instruction and the next two define the memory location.

If you continue using LMS instructions for each line on the screen, you can put every line on the screen in a different part of memory. This is not usually done. Instead, you can follow an LMS instruction with a Mode Line instruction, which tells ANTIC to keep incrementing the memory "pointer" for each consecutive line.

The last instruction in the display list is the "Jump on Vertical Blank" (JVB) instruction. A JVB tells ANTIC to wait until the television picture is completed, which is the end of a sixtieth-of-a-second cycle, then "jump" to the location it has in the two bytes that follow the JVB. The LMS and the JVB are both three-byte instructions. The Blank Line and Mode Line instructions are both one byte long.

All of this may mean very little to you without an example. To put an example together with the numbers in decimal would also mean very little because ANTIC interprets them in binary. Hexadecimal is a good compromise. In hexadecimal and decimal, the following is the program for ANTIC that BASIC sets up in response to a

GRAPHICS 18 statement (mode 2 without a text window):

Hex	Decimal	Instruction
70	112	Blank 8 lines
70	112	
70	112	
47	71	LMS ANTIC mode 7, = BASIC mode 3, plus 2-byte memory location. Display ANTIC mode 7
xx	xx	
xx	xx	
07	7	
07	7	
07	7	
07	7	
07	7	
07	7	
07	7	
41	65	JVB
xx	xx	
xx	xx	

As you can see, the ANTIC numbers for the modes are not the same as the BASIC numbers for the modes. As you become more familiar with display lists, you will find that there are more modes available than the few that BASIC allows. For this example, you need to know that BASIC's mode 2 is ANTIC's mode 7.

So, what has all this to do with moving characters around on a character-graphics screen? If there is nothing more to gain than being able to see what ANTIC's program looks like, then this looks like a mildly educational exercise, right? Read on.

Fine Scrolling

ANTIC has a few more little twists to it than just displaying normal characters on the screen, or even modified characters. It has fine scrolling capabilities, both horizontally and vertically. To use them, you must set the "mode-

line'' instruction of each line in the display list that corresponds to the line you want to be able to scroll. That's why you need to know what the display list looks like.

Fine scrolling allows you to move the entire character row (or all of the rows if you like, which is what the program at the end of this article does) one dot at a time horizontally and/or vertically. Using a combination of fine scrolling and moving the entire character a whole character position will allow you to move a character display smoothly.

To see how to enable the fine scrolling function, you must first take apart the two instructions that result in a line on the display. In hexadecimal, for an ANTIC mode 7 display, these instructions are the LMS instruction, 47, and the mode-line instruction, 07. In binary, these are 0100 0111 and 0000 0111. Using the numbering that makes the leftmost binary digit number 7 and the rightmost one number zero, the binary digits we want are numbers 4 and 5. Number 4 enables horizontal scrolling: 0101 0111 and 0001 0111. Number 5 enables vertical scrolling: 0110 0111 and 0010 0111. Setting both to one enables both: 0111 0111 and 0011 0111.

To use these from BASIC, we need the decimal equivalent. To enable horizontal and vertical scrolling, add decimal 48, which is binary 0011 0000. That changes the LMS from 71 to 119 and the mode-line instruction from 7 to 55. In decimal, the final display list for a GRAPHICS 18 screen would be: 112 112 112 119 xx xx 55 55 55 55 55 55 55 55 55 55 65 xx xx, where xx stands for a memory location not yet determined.

Special Memory Locations

Now that we know what to do with the display list, where do we find it? There are special memory locations in the Atari that can give us, or accept from us, all kinds of information. For example, locations 560 and 561 contain the location of the start of the display list. If we declare a GRAPHICS 18 screen in a program, then set a variable to `PEEK(560)+PEEK(561)*256`, that variable will have the location of the display list ANTIC is using. You can write a new location to 560 and 561 if you form one on your own, but it is usually easier to just modify the one BASIC has already set up.

In the program, we can find the display list, then modify all the instructions that display a line on the screen by adding 48 to it. That will enable the scrolling we want. We also need a few other special locations. Two locations are required to put the amount of

scrolling we want and one is required to turn ANTIC off when we change the scrolling values. If we don't turn ANTIC off, we get some very annoying "snow" on the screen. Other, less predictable things have been reported happening when ANTIC was on when scrolling values were changed.

The Program

It is always easier to see what is happening when you have a real example in front of you. Enter the program into your Atari so that your reading keeps up with the amount you have entered. That will make it easier to see what's going on.

Lines 1 through 150 are actually all explained in Part 1.

Lines 10 through 40 find a $\frac{1}{2}K$ boundary in the S\$ string. Lines 50 through 70 clear the S\$ string to ASCII code zeroes. Lines 80 through 100 move the "built-in" character set down (not required for this program). Lines 110 through 140 insert the special character into the set, and line 150 declares graphics mode 2 without a text window.

After you have lines 1 through 150 typed into your Atari, enter through line 162. Line 160 sets the variable DLIST

equal to the location where the display list created by BASIC starts. Line 162 looks at the memory location in that display list where the screen starts in memory. This is required later on.

From there through line 200, the program sets the enable bits on all of the ANTIC instructions that display a line on the screen. Since you know that one will be changed from 71 to 119 and the other from 7 to 55, you could use the number 119 in line 170 instead of $PEEK(DLIST+3)+48$ and 55 in line 190 instead of $PEEK(DLIST+1)+48$. The more generalized form in the program will make it more easily adaptable to other display list applications.

Moving up to line 224 presents a few unusual statements. These statements initialize everything that didn't fit into the above categories. VPOS and HPOS are initialized to somewhere in the middle of the screen. VPOS and HPOS are the vertical and horizontal positions — not character positions, but the positions in dots — of the figure we will be moving. Each character is 16 dots high and 8 dots wide. Line 222 sets the character set base address. This statement was also used in Part 1. WING (line 224) keeps track of which position the "wings" are in. S is initialized so that the bird will be flying up when the

main part of the program begins.

Lines 230 through 260 calculate the character position on the screen with the remainder from the division determining the fine-scrolling amount. Since the characters are 16 dots high and 8 dots wide in mode 2, these are the two values by which we divide. The SOUND statement doesn't have anything to do with the position, exactly. It is placed there as a matter of timing so that the "wingflapping" noise is initiated properly.

Lines 262 and 264 take care of putting the wings in the correct position, alternating by setting WING to 2 if it is 1 and to 1 if it is 2. Again, the subscripts for the S\$ string and the values for the CHR\$ function are explained in Part 1.

Finally, we get to where the real action takes place in the program. Line 266 puts a zero in location 559, which turns ANTIC off as soon as it finishes the current sweep of the screen. The next statement will not need ANTIC off, but will function as enough of a delay to guarantee that the current sweep of the screen is completed before the fine scrolling values are POKed into the special memory locations.

Line 270 erases the old position of the figure, then calculates the new position and puts the figure there.

TIRED OF TYPING? MICRO has the solution.

Order a diskette of three recent utility programs for the Apple. For only \$10.00, plus \$2.00 shipping and handling, you will receive a DOS 3.3 diskette containing the source and assembled listings of:

POSITION statements do not work when you enable the scroll because ANTIC automatically assumes a "wide playfield" instead of a normal one, which has 24-character lines instead of 20-character lines. That is why the formula $P = V * 24 + H$ is required. The variable P will be the "old" position for the next loop, so that you don't have to calculate anything to erase the old figure before you POKE the new one into place.

Lines 280 and 290 set the horizontal and vertical values into the special memory locations reserved for them. Note that the vertical scroll value runs in the opposite direction and must be subtracted from its maximum value, 15, to get the correct one. When these values are POKED, ANTIC is turned back on by POKEing 34 into location 559, as is done in line 292. Line 294 stops the "wing-flapping" sound and, like line 232, is positioned here for the sake of timing the sound.

Now that we have all of the statements in place for moving the figure around, we need some way to control where it moves. I chose the joystick for input. It is read at line 300. Line 310 causes all readings where the stick is in the "neutral" position to be ignored. These two statements will use the last non-neutral position for the direction, if the joystick is centered.

When you move the joystick, lines 320 through 390 interpret the movement into the new position by updating VPOS and HPOS. The vertical movements are all 2 dots at a time to compensate for the difference in the two dimensions so that the bird will fly up at about the same rate as it will fly horizontally. Lines 380 and 390 make sure the figure stays on the screen, then line 400 goes back to put the figure where you just moved it. Line 1000 is the character shape for the READ at line 120.

Now you can RUN the program and move the figure around the screen with your joystick. If you don't have a joystick, you should be able to figure out how to move it with the four arrow keys.

Notice that the figure does flash a little when you move it. This happens when you turn ANTIC off. This can be limited by decreasing the delay (line 270) after you turn ANTIC off. Remember that line 270 does not require that ANTIC be off, so it functions as the delay. You can shorten the delay as much as you like until you start getting snow on the screen when you move the figure horizontally. You can do this by breaking the line up so that the first statement executes before the POKE 559 statement. This snow is the problem you avoid by turning ANTIC off.

Note that I did include a few statements in the program that weren't described. These statements are set up to cause the bird to flap its wings when it is moving horizontally or up [i.e., VMOVE does not indicate "down"]. When the bird moves downward, the wings do not flap and the flapping sound stops.

The program is not the most efficient way to scroll character-graphics screens, but it does show the general idea of how it is done. You can make the program more efficient by doing things like replacing the part that reads and interprets the joystick with a faster routine. You may develop a different way of handling the positions from the VPOS and HPOS approach. If you keep the character position and the scroll values separately, you will not need the two divisions. If you do it right, you can gain some speed there. Remember that the program was written to be instructional rather than efficient, so you should find many areas where you can speed up.

Play around with the program until you get ideas on how to use character graphics for your own programming project. Your own project will familiarize you with the advantages of character graphics. Remember, too, that you are saving lots of memory.

OSI SOFTWARE

Superboard II

HEXDOS is a remarkable disk operating system which surpasses the capabilities of OS65D. But because HEXDOS uses subroutines in OSI's ROM BASIC, it is very compact (only 2K). HEXDOS provides you with easy-to-use commands and saves 10K of memory and disk space!

- Load or save BASIC programs, machine language, and data files by name. Chain BASIC programs from disk.
- Up to 22 data files may be open simultaneously.
- Resides at the beginning of RAM, leaving maximum space for user programs.
- Full trace of BASIC programs with optional single-stepping.
- True line editing allows you to correct mistakes easily.
- Supports random-access data files, real-time clock, and tone generator.
- Includes a disassembler and demonstration programs: CHECKBOOK and ADDRESSBOOK (personal data base management), LIFE, SURROUND, REVERSI, BACKGAMMON, and BSR CONTROLLER (home control).
- Satisfaction guaranteed, or your money promptly refunded.

"Documentation is clear and complete, the best I have seen from any source."

— Ronald C. Whitaker, **Compute!** magazine, April 1981

Price: \$49.50 (5¼-inch diskette and 40-page manual)

HEXASM is a powerful macro-assembler which supports conditional assembly, linked source files, symbol tables, and user-defined macros. Designed to replace OSI's considerably less powerful assembler. Also included: a simple editor for text files, a utility to renumber BASIC programs, and a disk tester/copier. Requires HEXDOS and 20K RAM.
Price: \$38.50 (diskette and manual)

TEC65 is an OSI version of DEC's popular TECO editing language. TEC65 allows you to perform complex editing tasks and major text reorganization with simple command strings. Right justification and title centering options for word processing. Requires HEXDOS.
Price: \$38.50 (diskette and manual)

FOCAL-65 is an implementation of DEC's unique programming language. With 9-digit floating-point arithmetic and transcendental functions, FOCAL-65 is especially suited for mathematical and scientific programs. Easy to learn and program. Requires HEXDOS and 16K RAM.
Price: \$66.00 (diskette and two manuals)

Your satisfaction guaranteed, or your money promptly and completely refunded. For more information, send \$1.00 for our catalog of OSI, Apple, AIM, KIM, and SYM software.

Apple Slices

By Tim Osborn

This month's column discusses one of the fundamental elements of any computer system, the block move. I also present a subroutine to perform block moves. If you find yourself saying "but the monitor already includes a block-move routine," read on; I'll show you why you may want to use my block move instead. I'll also show you why it is sometimes advantageous to use the monitor's routine.

What Is a Block Move?

A block move is a byte-by-byte movement of data from one range of memory to another. The area from where the data originates is called the source and the target area is called the destination. The length of the move is the difference between the source end and the source beginning plus one. The distance of the move is the difference between the source beginning and the destination beginning.

Let's use the monitor's routine to illustrate some examples of block moves. Type in the following sequence:

```
[CALL -151
  (enter the monitor)
*3000:01 02 03 04 05 06 07 08
  (initialize memory)
*3000 < 3002.3003M
  (move 3002 - 3003 to 3000 - 3001)
```

Now type:

```
*3000.3007
  (dump range of memory)
```

and receive the following dump:

```
3000- 03 04 03 04 05 06 07 08
```

Observe that the block move was successful. Now try this:

```
*3001 < 3000.3006M
  (move 3000 - 3006 to 3001 - 3007)
*3000.3007
  (dump range of memory)
```

and receive the following dump:

```
3000- 03 03 03 03 03 03 03 03
```

The computer first moved 3000 to 3001, then 3001 to 3002, and so on, so that the full destination range is filled with the same value.

This situation is called an overlap. When the destination is higher than the

source combined with an overlap, it is necessary to move the data starting at the source end working toward the source beginning, which is called a right-move, as opposed to a left-move. By doing a right-move in the above example and dumping the range of memory, the following results would be obtained:

```
3000- 03 03 04 03 04 05 06 07
```

These results are correct.

A similar problem exists where the destination start address is lower than the source start address and the two ranges overlap. In this case the right-move (source-end first) will cause the same sort of problems and it is necessary to use the standard left-move (source start first) to avoid these problems. When the ranges do not overlap, it makes no difference which type of move is used, either the right-move or the left-move.

The Block-Move Routine

BLOCK-MOVE (listing 1) incorporates the ideas expressed above by performing all block moves where the destination address is higher than the source address with a right-move and all moves where the destination address is lower than the source address with a left-move.

To install BLOCK-MOVE you must BRUN the object code. The routine START will enable the CTRL-Y vector by initializing a JMP \$310 (the address of BLOCK-MOVE's ENTRY routine) into \$3F8 through \$3FA. When the monitor encounters a CTRL-Y (control key pressed simultaneously with the Y key) it will effectively JSR to \$3F8. After START initializes the CTRL-Y vector the monitor will effectively JSR to ENTRY upon encountering a CTRL-Y.

The syntax to use BLOCK-MOVE is exactly the same as that to use the monitor M command:

(dest) < (start).(end)

The (end) statement is then followed by a CTRL-Y instead of the usual M. When execution reaches ENTRY the monitor subroutines have already converted:

1. (dest) to a sixteen-bit integer stored at \$42 through \$43 (A4L through A4H or A4).
2. (start) to a sixteen-bit integer stored at \$3C through \$3D (A1L through A2H or A1).
3. (end) to a sixteen-bit integer stored at \$3E through \$3F (A2L through A2H or A2).

All of the above values are in modulo-256 form in low-byte, high-byte order. A user-written program can make use of BLOCK-MOVE by setting up the above values and JSR'ing to ENTRY.

BLOCK-MOVE must first compute the distance (DISTL through DISTH, \$300 through \$301) by subtracting A1 from A4 and storing the results at DIST (see lines 54 through 60). After this, DIST is added to A2 to obtain the destination end address — A5 (lines 61 through 67). Next destination start is compared to the source start in lines 68 through 76. If the source start is greater than the destination start, the MOVELT routine is used to perform the block move. If the destination start is greater than the source start then MOVERT routine is used. If the destination start is equal to the source start then no move is performed and an RTS is done at line 74.

MOVERT takes bytes starting at A2

0384	122	END	

(source end) and moves them to A5 (destination end). It decrements both values moving another byte after each decrement until A5 = A4, which means the destination pointer is equal to the destination beginning. (See lines 84 through 101.)

MOVELT takes bytes starting at A1 (source start) and moves them to A4 (destination start). It increments both values moving another byte after each increment until A4 = A5, which means that the destination pointer is equal to the destination end. (See lines 107 through 122.)

Both routines return to the monitor (or user-written program) when they

have completed their task. Experiment with BLOCK-MOVE and the monitor move command to get a feel for the differences between the two routines.

The advantage of using the monitor subroutine is that it allows you to initialize memory to desired patterns of byte values. It can be very handy, for instance, to initialize ranges of memory to binary zeros, but it is not limited to that. All sorts of patterns can be created depending upon the nature of the overlap. For those times when you are moving data forward with overlapping ranges of memory, use BLOCK-MOVE.

MICRO™

Reviews in Brief

Product Name: The Programmable Cube
Equip. req'd: Apple II with 48K or 64K and DOS 3.3
Price: \$34.95 includes diskette and extensive documentation
Manufacturer: Metacomet Software
P.O. Box 31337
Hartford, CT 06103

Description: This program will solve a Rubik's cube. "Cube" will scramble a cube and solve it for you. It also has an option to make designs and patterns. It is easy to use and relies on standard cube notation for entering moves.

Pluses: *The Programmable Cube* comes with an extensive user's guide to teach how to write programs to make designs or even solve cubes based on your own cube-solving strategy. It has a "mirror" behind the graphics cube to show the obverse sides of the cube. The program also includes simulated rotation of the cube as moves are made. You can enter a cube of your choice or choose the order of the colors on the cube.

Minuses: The language, while not difficult to learn, is similar to many of the graphics-control programs and takes a fair amount of time to become familiar with it.

Skill level required: Ability to follow directions is needed to run the solving portion. Previous programming experience in any language would be a help to program in cube language.

Reviewer: Phil Daley

Product Name: Ghost Gobbler
Equip. req'd: TRS-80 Color Computer with 16K
Price: \$21.95/cassette; \$24.95/disk
Manufacturer: Spectral Associates
141 Harvard Ave.
Tacoma, WA 98466

Description: *Ghost Gobbler* is Spectral Associates' version of the popular arcade game, PAC-MAN. Using a joystick, you control a gobbler that travels around a maze eating dots. You must be wary of the four ghosts that also frequent the maze. If they catch you, you will be eaten. Your only protection is to eat an "energizer" dot, whereupon you can score points by gobbling the ghosts. There are 17+ screens, and extra points can be gained by gobbling bonus shapes. Extra men can be gained by scoring high.

Pluses: The game is in 6809 machine language, and comes on cassette. The program will load onto disk and execute properly from disk once loaded. The game is fast action, and operates smoothly in all skill levels. A teleportation spot allows the player to quickly escape to another section of the board. Sixteen skill levels are available, so novices and experts can compete on a more even scale.

Minuses: The game supports only one player at a time, though it does keep records of the ten highest scorers. It operates as a linear device rather than a switch type. Many

users complain of the joystick action at first, but practice does improve its action.

Documentation: A single sheet instruction.

Skill level required: Anyone who can handle a joystick can play the game, but expert skills are required to get past the first two or three screens.

Reviewer: John Steiner

Product Name: Speed Reader
Equip. req'd: Apple II with Applesoft in ROM and DOS 3.3
Price: \$
Manufacturer: Special Delivery Software
10260 Bandle Drive
Cupertino, CA 95014

Description: *Speed Reader* is a five-part reading program designed to improve comprehension and increase reading speed through the development of concentration, attention span, and more effective eye movement. Two copies of the *Speed Reader* Master Program diskettes, one copy of the *Speed Reader* Data diskette, and an easy-to-read manual are included in the software package. The main menu has five lessons: warm-up exercise (letters), warm-up exercise (words), eye movement exercise, column reading lesson, and reading passage lesson.

Pluses: The manual contains charts for each lesson on which progress can be recorded; user's scores are provided after each activity is completed. Several reading selections are offered in Lessons 3, 4, and 5, most of which are informative and interesting. You can increase reading speed, change column justification, and decrease window size in Lessons 3, 4, and 5.

Minuses: Vocabulary level and topics of several selections are beyond that of an average fifth-grade student. It is not clear to the user whether the RETURN key should be used to continue the program; no editing is permitted and selections cannot be added to the disk. Only one user can use *Speed Reader*; booting the diskette will not provide several users with the program.

Skill Level Required: Grades five through adult; private instruction. Spelling proficiency is a must as well as typing skills.

Product Name: GR2716 ROM/EPROM Emulator
Equip. req'd: Not applicable
Price: \$78.00
Manufacturer: Greenwich Instruments Limited
U.S. Distributor: LMS Electronics
3401 Monroe Road
Charlotte, NC 28205

Description: The *GR2716 EPROM Emulator* is a pin-for-pin replacement of the 2716 EPROM for use during system

Reviews in Brief *(continued)*

development. The device consists of RAM memory and a lithium power cell housed in a 24-pin package about .6 inches high. When used in the read mode, the device is plugged into a normal system EPROM socket, and functions exactly like an EPROM. Connectors with leads are supplied also. The package is provided with three additional wirewrap connections on the end between pins 1 and 24. Two of these pins are connected to the system reset to prevent inadvertent writing to the memory during system restart. When the third pin, labeled WE, is connected to a normal system static-write enable signal, it causes the circuit to function as a static RAM chip. The battery is guaranteed to retain memory for three years, with ten years quoted as typical. Other versions are available to replace other EPROMS.

Pluses: This processor performs exactly as specified. The documentation is terse, but adequate. New literature has come out since this review. Sample WE circuits are given for several CPUs.

Minuses: The legs appear fragile and could be broken easily. The problem can be circumvented by installing the GR2716 into a 24-pin soldertail socket and then plugging the entire assembly into the system. One other minor problem is the placement of the WE and Reset pins on the end of the device. There have been fit problems on crowded boards, but the chip-in-a-socket approach also solved this problem by raising the chip above board level.

Skill level required: Reasonably serious hardware and machine-language system software developer.

Reviewer: Wayne D. Smith

Product Name: Telewriter (disk version)
Equip. req'd: TRS-80C, 16K, RS disk system, printer
Price: \$49.95 cassette, \$59.95 disk
Manufacturer: Cognitec
704 Nob Ave.
Del Mar, CA 92014
(714) 755-1258

Description: Telewriter is a word processor for the TRS-80C. The editor features a cursor-oriented, 51- x 24-character display with real lower-case characters. The graphics screen is used for text display, and provides a much greater area of visible text than most color computer word processors.

Pluses: Telewriter is one of the better editors I have seen. Many features, including embedded printer commands, not found on more expensive processors, are available in Telewriter.

Minuses: Requires a disk I/O program on disks. The binary file format adds extra steps when using Telewriter with an ASCII file. Neither horizontal scrolling nor right justification is supported.

Documentation: Seventy pages of well-written reference material are included.

Skill level required: No previous experience with word processors is required.

Reviewer: John Steiner

MICRO

The watch is quiet. Scanners show nothing of rebel activity as you comb

QUADRANT 6112.

Suddenly, a stargate gapes open. A lone rebel ship surges into space. More alien comrades follow in attack. You must hold the Quadrant from the invaders. And you must do it alone!

You're combing the quadrant, defending your turf, and suddenly, as if from nowhere, an alien ship appears. You spin and shoot, lasers blazing and blast him into oblivion, with more attackers soon to follow. The battle continues and you gain the upper hand. Just when you think you've got things under control, the alien commander appears. He's extremely fast and a very good shot, but you have a secret weapon, HEAT SEEKERS! The flick of a finger destroys every alien in your quadrant. With a few seconds rest you prepare yourself for the next wave of alien attack ships. GET READY, HERE THEY COME... **FIRE!**

HOW TO WRITE A TRS-80

HOW TO WRITE AN APPLE

HOW TO WRITE AN IBM-PC

3 exceptional books join the DATAMOST library.

Here is a series of easy to read, easy to use, easy to understand books, which teach you how to write usable, useful programs on your computer. And you don't have to worry about irrelevant material which has no interest for you, because there are three specific volumes. One for the Apple,* one for the IBM-PC,* and one for the TRS-80.*

In each of these books author Ed Faulk leads you through your favorite computer and takes the mystery out of writing programs for it. As you proceed, interesting chapter by interesting chapter, you'll

wonder why you were ever intimidated by the thought of programming!

If you want to get the very most out of your Apple, IBM-PC or TRS-80 then you really want HOW TO WRITE A PROGRAM. Before you're past Chapter 2 you'll be programming. By the end of the book you'll be willing to tackle business programs, personal use programs and even games and adventures! **\$14.95**

Getting Around the Apple Hi-Res Graphics Page

by Eagle I. Berns

This article describes a method to split an Applesoft BASIC program in order to make available the core both above and below the hi-res pages. This allows the program to utilize the graphics area without having to sacrifice portions of memory.

GETTING

requires:

Apple II with 32K
RENUMBER

If your Apple II has 48K of memory, and you write a program that starts at \$0800 (hex) and goes to, say, \$4100, you may notice that though there's still a lot of core available for your program, you have lost the ability to use either of the hi-res graphics pages (the first runs from 2000 to 3FFF and the second from \$4000 to \$5FFF). When this problem came up for me, I wondered if there might be some way to have my program bridge the gap over either or both the graphics areas and continue on the other side.

In reading current literature I found various references to ways in which this could be done. However, they all required multiple steps and patching source statements. What I wanted was an automatic process. There are several EXEC files used in the process I eventually developed, but the user of the program need only issue the one command "RUN SPLIT", and the rest of the process is automatic.

The EXEC files and utility program needed to do the job are listed at the end of this article. First, however, I will give a general description of how the task is accomplished, and then a detailed description of the program itself.

Basically, the statements of the Applesoft program to be split are scanned via their internal pointer links from statement to statement, until the last

statement before location \$2000 is reached. At this point a number of dummy statements are inserted. (This version uses the &Renumber utility from the Apple II tool kit to renumber the program in a way that allows the insertion of a number of dummy statements. A simple modification is necessary if some other renumber utility is used.) The utility then proceeds to find the link that exists between the location before \$2000, and the location

directly after \$4000. It then finds the places to POKE, relinking the program across the dummy statements (where the graphics area is located). Since a LOAD will reset all links, the two POKEs must be a part of the original program. Also, since the POKEs must be there when the split is complete, they must be inserted before we begin the split, so as not to destroy the relative positioning of statements in the program.

Listing 1: SPLIT

```
100 TEXT : HOME
110 PRINT "ENTER NAME OF PROGRAM TO SPLIT": PRINT : PRINT : HTAB (7): INPUT
    AS
120 PRINT
130 PRINT "ENTER LOMEM ADDRESS FOR LOADING PROGRAM": PRINT : PRINT : HTAB
    (7): INPUT L
140 PRINT : PRINT "ENTER 1 IF SPLITTING OVER HGRI,"

350 REM
360 DS = CHR$ (4)
370 PRINT DS;"OPEN SPL.SETUP"
380 PRINT DS;"DELETE SPL.SETUP"
390 PRINT DS;"OPEN SPL.SETUP"
400 PRINT DS;"WRITE SPL.SETUP"
410 PRINT "FP"
420 PRINT "RUN LOADAPA"
422 PRINT "POKE 103,":B + 1
424 PRINT "POKE 104,":A
426 PRINT "POKE ":B,":0"
430 PRINT "LOAD ":AS
440 PRINT "&R 2,1"
450 PRINT "1 POKE 0000,000:POKE 0000,00"
460 PRINT "SAVE SPLITPROG"
470 PRINT "EXEC SPL.FINDER"
480 PRINT DS;"CLOSE SPL.SETUP"
490 PRINT DS;"EXEC SPL.SETUP"
```

When the RUN SPLIT command is issued, you see the following:

ENTER THE NAME OF THE PROGRAM TO SPLIT
<type in the name>

ENTER LOMEM ADDRESS FOR LOADING PROGRAM
<Normally this is 2048 (or \$0800), but you may change this, if you like>

ENTER 1 IF SPLITTING OVER HGR1
2 IF SPLITTING OVER HGR2
0 IF SPLITTING OVER BOTH

WHICH: <your choice depending on your needs>

Then wait as your screen goes through some contortions, writing messages, etc. Finally it will write out: END OF JOB. A program called SPLIT-PROG will have been created which, when run, will not be interfered with if hi-res graphics are used. Be sure to hold on to the original program for making

modifications since SPLITPROG does not accept modifications gracefully.

Now I will present the programs and support utilities, with a description of their execution sequence.

SPLIT Description

Lines 180-350 are POKEd away for the rest of the utilities to use. Loc's 210 and 211 are for program start-up location; 212 and 213 are the addresses for the boundaries of the split.

Lines 370-400 and 580-590 create and execute SPL.SETUP, which does the following:

FP	<cleans things up a bit>
RUN LOADAPA	<from Apple II Tool Kit>
POKE 103, <addr1>	<set up LOMEM for loading the user program to be split>
POKE 104, <addr>	
POKE <loc>, 0	

LOAD <program> <loads the program>

&R 2,1 <renumbers to allow a dummy line 1 to be inserted that will be modified>

1 POKE 0000,000:POKE 0000,00

SAVE SPLITPROG <this will eventually become the split program>

EXEC SPL.FINDER <goes off to find where to split>

SPL.FINDER Description

The EXEC is copied to the end of the user program and then that part is executed.

Lines 63980-63984 scan the program to be split to find the statement just preceding the hi-res page beginning.

Lines 63984-63986: if the program isn't large enough to require splitting, we stop here.

Lines 63987-63988 POKE away the statement number detected for later use.

Line 63989 invokes the next phase, which does the actual splitting process.

SPL.EXEC MAKER Description

Lines 5-6 compute the number of dummy REM SPLIT statements to be inserted to cover the appropriate graphics area.

Line 7 retrieves the line number where the split starts.

Lines 8-80 create and execute TEMPEXEC, which performs the following functions upon invocation:

Lines 31-34 set up the appropriate LOMEM value and then load SPLITPROG.

Line 35 renumbers the program to allow insertion of the REM split statements.

Line 36 adds a GOTO statement around the REMs so they can't be executed.

Lines 37-60 add the dummy REM statements.

Line 65 EXECs the final phase of the splitting process, which creates the appropriate POKE for line 1 to relink the final program execution.

Extra Colors for the Atari

by Richard I. and Donna M. Marmor

Two techniques are presented to achieve extra colors on the Atari screen. One uses alternating adjacent dots of different colors, while the other uses alternating displays of different colors.

Extra Colors

requires:

Atari 400/800 (8K)

Atari graphics modes are limited in the number of colors that can be displayed at any one time. In Mode 7, for example, only four colors can be used. There are many techniques available that will expand your choices. In this article we describe two of them and provide sample program illustrations.

Color Dot Mixing

With this technique you place pixels of different colors next to one another in an alternating pattern. For instance, a red pixel followed by a blue pixel followed by a red pixel, and so on. In a relatively large bounded area, such as a square, the overall perceived shade is distinct from the individual colors comprising the pattern. Using this approach, the number of distinct colors in Mode 7 expands to 10: primary colors 1, 2, 3, and 4; and the "mixed" colors 1-2, 1-3, 1-4, 2-3, 2-4, and 3-4. Of course, you must make a judicious choice of the four primary colors so that the mixed colors will look good and appear distinct.

Program 1 will help in your exploration of Color Dot Mixing. It places two sets of two squares on a Mode 7 screen, one against a white background and one against a black background. The program then asks you to type in a pair of color-luminance combinations. It colors a square in each set with each color you chose, and then shows you the result of the mix in a square directly below. Why are there two sets of squares? Since colors look different

```

against different background colors, we decided to experiment with different backgrounds.

You can easily modify this program to further enlarge the technique. Why not mix more than two colors? Or how about different cycles; one red pixel followed by two blue pixels, for example? Try background colors other than black and white. You'll really see the difference!

The possibilities from color dot mixing are great and they are suitable for many applications. The resulting colors, however, appear rather coarse to the eye. The next technique uses display list interrupts to create new colors that are much purer and far more pleasing to the eye.

Color Dot Alternation

To understand this technique, we must first review some Atari display theory. When you look at a display on your television or monitor, it appears almost as if the display is painted on the screen. Actually, the display is being regenerated by ANTIC, 60 times per second. But this is so fast that you don't see the resulting flicker.

An explanation of the display list and display list interrupts appears in many places, so we won't go into that in great detail: just enough to give a frame of reference. Every 60th of a second (or frame), ANTIC goes through its display list and associated display memory, retrieving the color register number for a given pixel from display memory and displaying the pixel at the correct point on the screen in the color specified in the appropriate color register. What would happen if, on alternate frames, different colors were displayed for the same pixel? During frame 1, for instance, the color of a pixel might be red. During frame 2, it might be blue. During frame 3, it would go back to red, and so on. The result, according to color wheel theory, is that the pixel should appear purple. And indeed it does. If you kept track which pixels of your display should be pure red, which should be pure blue, and which should be alternating red-blue, you would obtain three pure and distinct colors for the price of two! In a Mode 7 display, this makes 10 colors a possibility.

This technique may be implemented in several ways. Program 2 demonstrates one way. As in program 1, program 2 asks you to type in two color-luminance combinations. These colors are displayed in separate squares, and then below them a rectangle is displayed with the colors alternating on different display frames.

The alternation is produced by the

```

display list interrupt routines shown in listing 3. In listing 2, the routines are POKEd into memory at lines 220-280. When the routines are executed in their appropriate frames, the color register used for the third square is flip-flopped between the two colors you chose. During the odd frames, the color register is set to the first color. During the even frames, the color register is set to the second color. Each interrupt routine causes the other one to execute during the next frame by modifying the display list interrupt vector. The input colors are set into the interrupt routines by line 290. The result on the screen is that the third square has a different color than the other two.

To fully utilize Color Dot Alternation, some additional programming is needed. You must keep track of which pixels are to be mixed and which are not. This can be accomplished by using multiple display list interrupts in con-

junction with tables giving the mode lines to be mixed.

The implementation given here uses two display list interrupts for alternate frames. Another method is to use a single display list interrupt that flip-flops a color register. You would change the contents of the color register during alternate frames. A final method, although costly in memory, is to have two separate display memories. One would contain the color register numbers used during the odd frames, and the other would contain the color register numbers used during the even frames. If a pixel is to be a pure color, its associated color register number would be the same for odd and even frames. If a pixel is to be mixed, its color register number would alternate in the two display memories between the two registers to be mixed. A display list interrupt would be used to change the display list itself to point to the two

display memory areas for different frames.

One warning about this technique. When you alternate between colors of different luminances, flickering will occur. The flickering will worsen as the luminances get farther apart and will be almost non-existent when the luminances are the same, especially with the higher color numbers. This flicker effect can be very useful for special effects in your programming.

The expansion possibilities for Color Dot Alternation seem endless. You can experiment with cycles of three or more. With a cycle of two, your color palette is 256. With higher cycle numbers, the choices are greater, of course. We have used the technique effectively with cycles of up to four.

Both Color Dot Mixing and Color Dot Alternation are simple techniques that expand the color possibilities of your Atari. By using these techniques, or variations, you can begin to realize the full graphics potential of your computer.

Introduction to 3-D Rotations on the Apple

by Chris Williams

The techniques of 3-D rotation are discussed. An Applesoft demonstration program is provided, which includes general-purpose routines for yaw, pitch, and roll.

ROTATE

requires:

Apple with Applesoft

I am fascinated by the computer-generated special effects recently proliferated through the film industry. The primary building block for these special effects is the 3-D rotation. I've discovered that these effects are remarkably easy to produce; this article and program pass on the techniques required.

The program is written entirely in Applesoft and isn't offensively slow, but don't expect fluid motion. The program documentation is thorough, but you should make two copies (one with REMs, one without). Executing the REMed program will try your patience.

I won't provide an in-depth discussion on the math; you don't need to understand it to do rotations. Just strip out my subroutines and use them where you need them.

The program draws a hi-res 3-D rectangular box and then rotates it. The rotation occurs in discrete steps of 15 degrees. It takes about 90 seconds to rotate through 360 degrees.

This box is a real-world object — it has height, width, and depth. The task in doing 3-D display is to project real-world objects onto a two-dimensional surface.

Figure 1 is the Apple hi-res screen for X and Y. Z is supposed to be an axis drawn out of the screen and perpendicular to it. Since that can't be done, represent Z as a line drawn at a 45-degree angle, upper left to lower right. This line allows you to put depth on the screen.

Figure 2 introduces the box and shows how the 3-D to 2-D projection works. Notice that the corners of the

object are numbered points. They correspond to the CR array in the program. This array is dimensioned (3,8). The object has eight corners and each corner has three elements representing X, Y, and Z coordinates. Lines 170 through 400 of the program simply define the box in 3-D space.

Now you need to project it onto the 2-D plane. X and Y coordinates correspond precisely so they pose no problem. The Z coordinate is another matter.

Since Z is defined to be at 45 degrees to both X and Y, then the Z coordinate

is related to X and Y as $X = \sin(45) * Z$, $Y = \sin(45) * Z$. Sine and cosine of 45 degrees are both .707. Specify a corner's position in 3-D space as CR(1,I), CR(2,I), and CR(3,I) where I selects the corner and 1,2,3 is XYZ. A corner's 2-D projection onto the X-Y screen is computed in lines 490 and 500 using $X = X + .707 * Z$, $Y = Y + .707 * Z$. Lines 510 and 520 are there merely for scaling and putting the box near the center of the screen.

The edges of the box are defined even more simply. They are in a table look-up contained within arrays I1 and I2. Notice that both these arrays are dimensioned as 12 as there are 12 edges on the box.

The number in each element of these arrays is a corner (see figure 2). That means an edge exists from point I1(I) to point I2(I). If you look at lines 550 through 590, you'll see HPLLOT draws an edge from X(I1(I)), Y(I1(I)) to X(I2(I)), Y(I2(I)).

That's all it takes to draw a 3-D box. You can convince yourself of this by turning off the rotation in the program (insert line 455 GOTO 480). This will display the box in X,Y.

Now take out the GOTO and try rotating. Here, the problem is again one

of axis definition. Refer back to figure 1. Call rotation about the Z axis — Roll, about the X axis — Pitch, and about the Y axis — Yaw. The program does a Yaw rotation only.

The trick is in the matrix multiply. If you let a given corner's coordinates be X1,Y1,Z1, then

$$\begin{pmatrix} X2 \\ Y2 \\ Z2 \end{pmatrix} = \begin{pmatrix} \text{ROTATION MATRIX} \end{pmatrix} \times \begin{pmatrix} X1 \\ Y1 \\ Z1 \end{pmatrix}$$

where X2,Y2,Z2 is that point's new, rotated coordinates.

If you don't understand that, don't worry. You'll be able to just plug numbers; you won't need to understand it.

The rotation matrix above is defined in lines 620 through 720. The angle for the sine and cosine call comes from line 450 where degrees are incremented by 15 each time through the loop and then converted to radians.

The choice of where the sine and cosine terms go in the rotation matrix determines whether the rotation is Roll, Pitch, or Yaw. Looking at the program, see that for Yaw

$$\text{DIM RT}(3,3) = \begin{pmatrix} c(\text{Yaw}) & 0.0 & s(\text{Yaw}) \\ 0.0 & 1.0 & 0.0 \\ -s(\text{Yaw}) & 0.0 & c(\text{Yaw}) \end{pmatrix}$$

How to run a listing in MICRO's Software/Hardware

The Software and Hardware Catalogs are provided as a service both to our readers and to the manufacturers. These entries are not MICRO reviews, but descriptions provided by the manufacturer.

To run a free listing in either catalog, a company fills out the appropriate form or merely mails in their material in the same format that appears in the magazine.

We try to limit entries to one company per month, on a first-come-first-serve basis.

If you sell products our readers should know about, write to Software/Hardware Catalog, MICRO, P.O. Box 6502, Chelmsford, MA 01824.

If you'd like to do Pitch rotations, rearrange the array to look like this:

$$\text{DIM RT}(3,3) = \begin{pmatrix} 1. & 0.0 & 0.0 \\ 0.0 & c(\text{Pitch}) & -s(\text{Pitch}) \\ 0.0 & s(\text{Pitch}) & c(\text{Pitch}) \end{pmatrix}$$

And for Roll rotations, like this:

$$\text{DIM RT}(3,3) = \begin{pmatrix} c(\text{Roll}) & s(\text{Roll}) & 0.0 \\ -s(\text{Roll}) & c(\text{Roll}) & 0.0 \\ 0.0 & 0.0 & 1.0 \end{pmatrix}$$

If you don't know matrix algebra, it

doesn't matter. Just rearrange lines 680 through 720 to produce arrays as shown above and you can rotate any way you wish.

That's all there is to 3-D rotation. I cringe as I say that because there are all sorts of things to be reckoned with. Refraction, shading, and hidden lines and objects are not topics to be discussed in an article with a title like this one. But the program here is a good foundation.

There is room for improvement, of course. The more adventuresome readers might try defining other 3-D shapes and then rotating them. The subroutines are all there. Or you might work for speed; a more fluid update would certainly be a plus. Let me know what you come up with.

Mr. Williams is an electrical engineer/writer. He may be contacted at 5676 S. Meadow Lane #101, Ogden, UT 84403.

SOFTWARE FOR THE APPLE II*

ISAM-DS is an integrated set of Applesoft routines that gives indexed file capabilities to your **BASIC** programs. Retrieve by key, partial key or sequentially. Space from deleted records is automatically reused. Capabilities and performance that match products costing twice as much.
\$50 Disk, Applesoft.

PBASIC-DS is a sophisticated preprocessor for structured **BASIC**. Use advanced logic constructs such as **IF...ELSE...**, **CASE**, **SELECT**, and many more. Develop programs for Integer or Applesoft. Enjoy the power of structured logic at a fraction of the cost of **PASCAL**.
\$35 Disk, Applesoft (48K, ROM or Language Card).

DSA-DS is a dis-assembler for 6502 code. Now you can easily dis-assemble any machine language program for the Apple and use the dis-assembled code directly as input to your assembler. Dis-assembles instructions and data. Produces code compatible with the S-C Assembler (version 4.0), Apple's Toolkit assembler and others.
\$25 Disk, Applesoft (32K, ROM or Language Card).

FORM-DS is a complete system for the definition of input and output forms. **FORM-DS** supplies the automatic checking of numeric input for acceptable range of values, automatic formatting of numeric output, and many more features.
\$25 Disk, Applesoft (32K, ROM or Language Card).

UTIL-DS is a set of routines for use with Applesoft to format numeric output, selectively clear variables (Applesoft's **CLEAR** gets everything), improve error handling, and interface machine language with Applesoft programs. Includes a special load routine for placing machine language routines underneath Applesoft programs.
\$25 Disk, Applesoft.

SPEED-DS is a routine to modify the statement linkage in an Applesoft program to speed its execution. Improvements of 5-20% are common. As a bonus, **SPEED-DS** includes machine language routines to speed string handling and reduce the need for garbage clean-up. Author: Lee Meador.
\$15 Disk, Applesoft (32K, ROM or Language Card).

THE TACKLER™

DUAL • MODE PARALLEL INTERFACE FOR THE APPLE®
2 BOARDS IN ONE FOR NO MORE COMPATIBILITY PROBLEMS!

An intelligent board to provide easy control of your printer's full potential. Plus a standard parallel board at the flip of a switch - your assurance of compatibility with essentially all software for the APPLE®. Hires printing with simple keyboard commands that replace hard to use software routines. No disks to load. Special features include inverse, doubled, and rotated graphics and many text control features, available through easy keyboard or software commands.

It's simple to print HIRES graphics from an APPLE computer with The Tackler from TYMAC. This is the first truly universal parallel interface! Plus the ROM for your specific printer. Sophisticated intelligence when you need it, total compatibility that never lets you down.

Change printers - no need to buy another board. Just plug in one of our ROM'S and you're all set. ROM'S available for Epson, C. Itoh, NEC, and Okidata - others available soon.

You've asked us to make THE TACKLER better than the others and we did. **\$159.00***

UPGRADEABLE PARALLEL PRINTER CARD

A Universal Centronics type parallel printer board complete with cable and connector. This unique board allows you to turn on and off the high bit so that you can access additional features in many printers. Easily upgradeable to a fully intelligent printer board with graphics and text dumps. Use with EPSON, C. ITOH, ANADIX, STAR-WRITER, NEC, OKI and others with standard Centronics configuration. **\$139.00**

THE PERFORMER PRINTER

FORMATTER BOARD for Epson, OKI, NEC 8023, CITOH 8510 provides resident HIRES screen dump and print formatting in firmware. Plugs into Apple slot and easy access to all printer fonts through menu with PR# command. Use with standard printer cards to add intelligence. **\$49.00** specify printer.

THE MIRROR FIRMWARE FOR NOVATION APPLE CAT II®

The Data Communication Handler ROM Emulates syntax of an other popular Apple Modem product with improvements. Plugs directly on Apple CAT II Board. Supports Videx and Smarterm 80 column cards, touch tone and rotary dial, remote terminal, voice toggle, easy printer access and much more. **List \$39.00** **Introductory Price \$29.00**

DOUBLE DOS Plus

A piggy-back board that plugs into the disk-controller card so that you can switch select between DOS 3.2 and DOS 3.3. DOUBLE DOS Plus requires APPLE DOS ROMS. **\$39.00**

SOFTWARE

NIBBLES AWAY II

AGAIN! Ahead of all others.

- **AUTO-LOAD PARAMETERS** . . . Free's the user from having to Manually Key in Param values used with the more popular software packages available for the Apple II.
- **EXPANDED USER MANUAL** . . . incorporates new Tutorials for all levels of expertise; Beginners Flowchart for 'where do I begin' to 'Advanced Disk Analysis' is included.
- **TRACK/SECTOR EDITOR** . . . An all new Track/Sector Editor, including the following features: Read, Write, Insert, Delete Search, and impressive Print capabilities!
- **DISK DIAGNOSTICS** . . . Checks such things as: Drive Speed, Diskette Media Reliability, and Erasing Diskettes.
- **HIGHEST RATED** . . . Best back up Program in Softalk Poll (Rated 8.25 out of 10).
- **CONTINUAL UPDATES** . . . Available from Computer Applications and new listings on the source.

\$69.95

Mr. Happy

Super PIX HIRES SCREEN DUMP - - -

The Software package that will allow your printer to dump page 1 or page 2 of the Apple Hires screen horizontally or vertically. Use with EPSON® MX-80 with or without GRAFTRAX® Roms, MX-70 - OKI® Microline 80, 82, 83, 82A, 83A - C. ITOH® 8510 and NEC 8023A. Requires Tymac Parallel Printer Board PPC-100 . . . **\$24.95.**

APPLE LINK - A versatile modem utility that provides the Apple user the ability to transfer disk files and software over the phone. Only one package needed for full transfers. Compatible with all DOS file types. **\$59.00** (requires Hayes Micro Modem)

THE APPLE CARD - Two sided 100% plastic reference card Loaded with information of interest to all Apple owners. **\$3.98**

6502 DEBUG! FAST 'n EASY The PTD Language Way

```
05 LOC1 = $7C80
10 PC = $3FC7
20 LABEL: STEP 100 NODISP
30 IF X<$3E OR @LOC1#$17 THEN GOTO LABEL
40 PRINT "HERE IS THE CULPRIT"
50 SHOW<100
```

PTD-6502 is a high speed, compiled BASIC-like language, light years ahead of the Apple II Single Stepper and far more sophisticated than any other 6502 debugger available. It allows you to sit back effortlessly while your computer glides through your code at a thousand instructions per second looking for your bugs. Or you can select a slower speed with updated display of memory. A paddle-controlled single stepper mode is also available. At either of the slower speeds, the PTD-6502 monitors and saves the last 128 instructions executed for review at any time.

Virtually unlimited breakpoint complexity is permitted with the PTD-6502. IF statements with mixed AND's and OR's can be created to test conditions such as memory change, memory = value, instruction location, . . . and many others. You can have as many named breakpoints as you wish in both ROM and RAM.

Some other features of the PTD-6502 include • Fast subroutine execution. • Hex calculator/converter. • Hex/ASCII memory dump. • Up to 16 machine language cycle timers. • Ability to monitor specific labeled areas in memory while stepping. • Effective address. • Accessible monitor commands. • A documented module for relocation of the PTD-6502 to virtually any location (source code supplied).

The debugging program shown on the monitor is a simple example; it could be far more complex. If you can think of it, you can probably scan for it at 1000 instructions per second. If you're a professional, the PTD-6205 can pay for itself in the first few hours of use. If you're a novice, you'll soon be debugging like a pro.

ORDER: PTD-6502 Debugger
including DOS 3.3 Disk
and instruction manual

\$49.95

(Note that disk is not copy protected. Order only one for each business or institution.) In California, add 6.5% sales tax.

PTD-6502 requires Autostart ROM for fast breakpoint.

From Here to Atari

By Paul Swanson

We are pleased to introduce our new Atari Column. Paul Swanson has published articles in several microcomputer magazines and has authored a book on disk techniques. He runs his own software consulting firm and markets a full-size keyboard for the Atari 400.

The Atari has two microprocessors instead of one, unlike what you would find in most systems. The main processor is the 6502. Atari, Inc., custom-made the second processor, ANTIC, which is used to control just the graphics screen. A few other custom chips in the Atari are not full microprocessors, but you can control them through the hardware registers.

Taking advantage of all the Atari's special hardware can be quite complicated. Fortunately, because of the various graphics modes available, much of this hardware can be accessed through BASIC without knowing very much about the hardware itself.

You can write simple programs using the information in the BASIC Reference Manual supplied with the BASIC cartridge. More complex programs that take advantage of Atari's special chips require more information. I will supply you with details of this special hardware in upcoming columns.

Each month's column will focus on some feature of Atari's hardware. I intend to take these topics from letters I receive, so if you have questions or need more information on a specific function, send me a letter at 97 Jackson St., Cambridge, MA 02140. (If you don't want your name mentioned, be sure to note that in your letter. I will include excerpts from letters in my columns.)

In addition to answering questions concerning the Atari, this column will also contain information on new hardware and software from Atari and other manufacturers. Already available from second sources are memory boards for both the 800 and the 400. The 32K board (for both) has been available from several different companies for over a year now. There is also 48K on a single card that you can plug into your 400.

I've heard of a 64K board but haven't seen it yet. The Atari can't address 64K directly because of the 16K reserved for the operating system ROM and the hardware registers. The 64K board is bank-selectable so it doesn't exceed the 48K allowed. Available pseudo disks give you 128K of memory that you can access as if it were a disk.

Many new products have been announced for the Atari, and many are about to be announced. Much of the new software available is in response to Atari Inc.'s interest in home educational applications. *My First Alphabet*, by Fernando Herrera, is still one of the best educational software packages available for younger children. A new program called *Master Type*, from Lightning Software, makes an interesting spaceship game out of learning touch typing. If you want to learn how to type, you may want to get your local computer store to demonstrate this program for you. It is listed at \$39.95, requires 32K and a disk drive, and keeps your interest with 17 levels of complexity. These two software packages, as well as the memory boards, are available at most computer stores that carry Atari.

This column, on occasion, will try to clarify conflicting rumors. For example, I have heard three or four people asking about the "special vector" you can use in the Atari to get rid of the key click. I can appreciate the need for eliminating that noise — it seems much louder when everyone else is asleep — but I disassembled part of the operating system looking for the keyboard click and found no place to POKE anything that would eliminate it. The part in question is in ROM and you can't alter ROM with a POKE. It doesn't check with any RAM locations before the JSR (Jump to SubRoutine) that produces the click. The only ways I can see to eliminate the click include physically disconnecting the keyboard speaker or writing your own keyboard handler. Even writing the keyboard handler would not eliminate the click under every possible condition; you have to initiate the handler every time one of a variety of different things happens.

Future columns may also include a listing of a short utility program (BASIC) that is in the public domain. No

machine-readable copies will be available. If you really don't want to type it in, check with your local user group to see if anyone already typed it in.

My December column will feature the Atari Regional Software Acquisition Centers; January will include available technical literature. December's column will be of particular interest if you plan to market any of your Atari software. January's topic covers places where you can find lists and explanations of all those special memory locations that you need to develop fancier software.

MICRO

It Pays to Write for MICRO!

Get paid for your ideas: write for MICRO! Thousands of people read MICRO every month. MICRO is sold in computer stores and on newsstands worldwide. Send for a copy of our Writer's Guide now. Our author payment rate is competitive with the leading magazines in the industry.

We welcome articles on any aspect of 6502/6809/68000 hardware and software for the Apple, Atari, CBM/PET, TRS-80 Color Computer, VIC, OSI, 6809, or 68000. Topics for upcoming issues are: Programming languages (besides BASIC), Communications, Operating Systems, and new Computers.

What's eating your Apple?

Find out with Apple-Cillin II™

It's a fact of computer life. Software and hardware interact. If there's a problem eating your Apple, you can spend hours trying to find out whether software or hardware is the culprit. Unless you have Apple-Cillin II.

Apple-Cillin II is a comprehensive diagnostic system developed by XPS to check the performance of your Apple II computer system. Apple-Cillin II contains 21 menu driven utilities to thoroughly test the operation of your system, and either identify a specific problem area or give your system a clean bill of health. Quickly and easily.

Apple-Cillin II works with any 48K Apple system equipped with one or more disk drives.

To order Apple-Cillin II - and to receive information about our other products - Call XPS Toll-Free: 1-800-233-7512. In Pennsylvania: 1-717-243-5373.

Apple-Cillin II: \$49.95. PA residents add 6% State Sales Tax.

NEW SOFTWARE for TRS 80 Model III and the Color Computer

■ Church Contribution System

designed to simplify and facilitate the tedious chore of recording envelopes. Provides a variety of reports. Maintains its own data-files. Only **\$150**

■ Data Base Manager

designed to help organize all your data and provide you with meaningful reports. Add or delete any information. New files can be created and old information transferred. Only **\$150**

■ Single Entry Ledger

designed as an uncomplicated control of finances for home or small business. Add, delete, edit at any time. Compatible with DBM. Only **\$95**

Write or phone for complete software price list.

6809 Bibliography

78. Color Computer News, Issue No. 10 (July, 1982)

- Jackson, Jesse W., "TTYPELOG," pg. 58-60.
A utility for the Color Computer to log tape information to your printer.
- Rouse, Alan, "Mortgage," pg. 62-64.
A "What If" program for the Color Computer.
- Eichman, Steve, "Shaplist," pg. 65-67.
An Inventory/File program for the 6809-based Radio Shack Color Computer.
- Aker, Jack L., "BASIC Program Line Mover," pg. 69-70.
A utility for a Color Computer with Extended BASIC, and 16K or 32K memory.
- Becus, Georges A., "TRACETXT Listing Produced by PRIN-TXT CTRACE," pg. 71-75.
A trace utility for the 6809-based Color Computer.
- Pretty, Richard, "A Pull on Your 'Art' Strings," pg. 77.
A simple string art program for the TRS-80 Color Computer.
- Barnes, Mark, "Gold Mine," pg. 78-81.
A graphics maze game for the 6809-based Color Computer.
- Wright, Darrel, "Convert That File," pg. 83-84.
A utility program to convert a Telewriter text file to a standard ASCII data file or vice versa. For the TRS-80 Color Computer.
- Peterson, Russell M., II, "Exploring Graphics Modes," pg. 87-88.
Using the SDS80C Editor/Assembler on the TRS-80 Color Computer.

79. 80-U.S. Journal, 5, No. 7 (July, 1982)

- Roberts, R.N., "Togetherness," pg. 88-89.
Tape merge for the 6809-based TRS-80 Color Computer.
- Causar, R. Shane, "17K of RAM," pg. 94-95.
Squeeze extra space from memory on your TRS-80 Color Computer. This is done by saving 1K of memory out of a program requiring 16K of memory.

80. The Rainbow, 2, No. 1 (July, 1982)

- Parkman, Bob, "Silent Answer," pg. 4.
A driver to interface a TI Silent 700 with the 6809-based TRS-80 Color Computer.
- Mir, Jorge, "Let's Go On A Simple Rainbow Adventure," pg. 9-17.
An adventure-type program for the Color Computer.
- Blyn, Steve, "Design Programs to Help Children Learn," pg. 18-19.
BEEPEROO is a simple program for the Color Computer which can be used to reinforce the concept of simple addition of three-digit numbers.
- Penrose, Paul, "Playing Around With Your 80C," pg. 22.
Playing music with the TRS-80 Color Computer.
- Morgan, Alan J., "Synchronizing with Your SAM Chip," pg. 24-25.
Using the 6883 SAM chip with the 6809-based Color Computer.
- Nolan, Bill, "Make Magic Rings on Magic 80C," pg. 27-29.
For addicts of fantasy role-playing programs, this Color Computer listing rolls up magic rings for you.
- Rutledge, E.P., "Disk File Helps You Keep Track of Everything," pg. 30-33.
A utility for the 6809-based Color Computer.
- Lewandowski, Dennis S., "Let's Soak Up Some Assembly," pg. 38-39.
A second tutorial on 6809 assembly-language programming.
- Ebbert, Jim, "Is There Any Escape from No Escape?," pg. 42-45.
A space-navigation graphics program for the Radio Shack TRS-80 Color Computer.

- Waclo, John, "The NFL Report Can Choose This Fall's Winners," pg. 50-64.
Put the National Football League on your Color Computer.

81. Compute! 4, No. 1 (January, 1982)

- Mansfield, Richard, "BRANCH NEVER and QUIF Assembling on SuperPET," pg. 146-149.
An instructional article for SuperPET users.

82. Microcomputing, 6, No. 8 (August, 1982)

- Whitman, James A., "Pascal and BASIC Square Off, Continued," pg. 22.
Benchmark tests including data on the 6809-based TRS-80 Color Computer.

83. MICRO, No. 51 (August, 1982)

- Steiner, John, "Interfacing the Color Computer," pg. 33-36.
Circuits to interface the TRS-80 Color Computer to an RS-232 port and a motor control relay are presented. A Morse Code send/receive program is included as a demonstration.
- Staff, "MICRO Reviews in Brief," pg. 39-41.
Reviews include discussion of a disassembler for the 6809 and the Compuvoice Synthesizer for the 6809-based Color Computer.
- Dial, Wm. R., "6809 Bibliography," pg. 118.
Some 26 items relating to 6809 literature are listed.

84. 80 Micro, No. 52 (September, 1982)

- Miller, Franklyn D., "The Colorful Computer — Part II," pg. 152-162.
Twenty programs for the 6809-based TRS-80 Color Computer.
- Tucker, Richard, "Cheaper Upgrade," pg. 186-188.
Do it yourself and save substantial cost in converting a 4K Color Computer, 8K Color BASIC to a 16K Extended Color BASIC by installing the new ROM yourself.
- Norman, Scott L., "Pascal Goes Color," pg. 198-202.
Compiled Pascal for the Color Computer is discussed.
- Sprouse, Gerald, "Joystick Paintbrush," pg. 230-232.
Use the Color Computer like a drawing board, employing two programs listed.
- Osborne, Frank H., "Conversion," pg. 238-240.
Rewrite Level II BASIC programs to run on the 6809-based Color Computer.
- Heusinkveld, John, "PCLEAR 0," pg. 282.
Make hi-res graphics use high memory on the 6809-based Color Computer.

Software Catalog

Name: **Adventure to Atlantis**
System: Apple II
Memory: 48K
Language: Machine Code
Hardware: One disk drive
Description: This game combines the best features of adventure games, arcade games, and fantasy role-playing games. *Adventure to Atlantis* is a sequel to *Odyssey: The Complete Adventure*. The struggle between the forces of magic (The High One) versus the forces of science (The Atlanteans) continues. The game uses four methods to grab the player's attention: high-resolution color graphics and animation, sound effects to enhance the action, random events at all stages of the adventure, and embedded arcade-like action.
Price: \$40.00
 Includes one floppy disk.
Author: Robert C. Clardy
Available:
 Synergistic Software
 830 N. Riverside Drive
 Suite 201
 Renton, WA 98055

Name: **The Business Bookkeeping SystemTM**
System: Apple II, Apple II Plus, Apple III
Memory: 48K
Language: Applesoft BASIC
Hardware: Two disk drives, video monitor, printer, emulation mode (Apple III)
Description: *The Business Bookkeeping System* is a cash accounting system that includes general ledger, customer activity, vendor activity, and employee activity. It contains eleven general ledger reports, five customer activity reports, four vendor activity reports, and six employee activity reports.
Price: \$395.00
 Includes indexed documentation, ten diskettes, toll-free software support.
Available:
 Dakin 5 — Authorized Apple dealer

Name: **Astro Blast**
System: TRS-80 Color Computer
Memory: 16K/cassette 32K/disk
Language: Assembly
Hardware: Joysticks
Description: *Astro Blast* is a space "shoot-em-up" featuring the highest resolution graphics, lots of color, and dramatic sound effects. Wave after wave of alien attackers are a challenge to your joystick and fire-button skills. Three selectable skill levels coupled with automatic game acceleration challenge both novice and professional.
Price: \$24.95/cassette \$29.95/disk
 Includes full instructions.

Name: **Frazzle**
System: Apple II or Apple II Plus
Memory: 48K
Language: 6502 Assembly
Hardware: Disk Drive (Dual DOS 3.2/3.3)
Description: Muse announces the release of *Frazzle*, the computer game that puts you in the future. The scene begins in space, with you commanding a Frazzle Force Ship that is suddenly under attack by Beasties. Colorful screen graphics show your position on the ship's radar screen, the force field surrounding you, and odd-shaped Beasties zooming in. Your ammunition is pulsating Energy Probes, which beep and flash as you release them on the screen. You must stop the Beasties while avoiding collisions with them, with the walls of the force field, and with your own ammunition. Sound effects include the electronic hum of a radar monitor and the squish of Energy Probes dissolving the Beasties.
Price: \$24.95
Author: J.C. Nolan
Available:
 Direct from Muse and computer stores nationwide

Name: **K-Razy Kritters**
System: Atari 400/800
Memory: 8K
Language: Machine Code
Hardware: ROM Cartridge
Description: This challenging celestial adventure with ten levels of play begins with three command ships. The player's active command ship attempts to destroy free-falling alien patrol "Kritters" descending from above. Weapons include standard missiles and super-missiles. If a command ship is destroyed, a sanitation crew will remove the wreckage.
Price: \$39.95 suggested retail
 Includes ROM cartridge and instruction booklet.

MICRO

ATARI 400/800

Atari 400 and 800 are color-and-sound computers. 6502 is the main processor and ANTIC handles video. Atari 400 has a membrane keyboard and Atari 800 has a full-size typewriter keyboard.

Peripherals may include up to four disk-drive units, a cassette unit, printer, and the 850 interface module. Four programmable controller ports handle joysticks, paddles, light pens, and other accessories.

Sophisticated graphic capabilities include: 256 colors (16 may be displayed on the screen at once), 17 graphic modes (6 character and 11 map), high-resolution graphics (up to 320 x 192), and powerful player/missile graphics.

Some Useful Memory Locations on the Atari

Page 0 Locations:

Hex	Dec	Length	Name	Description
0010	016	1	POKMSK	IRQ mask
0012	018	3	RTCLOK	Real time clock 018 is hi order
0041	065	1	SOUNDR	Noisy I/O flag
0042	066	1	CRITIC	Critical I/O flag
004D	077	1	ATTRACT	Attract mode flag
0052	082	1	LMARGIN	Left margin
0053	083	1	RMARGIN	Right margin
0080	128	2 *	LOMEM	Buffer used to tokenize line of BASIC
0082	130	2 *	VNTP	Variable name table start
0084	132	2 *	VNTD	Variable name table dummy end
0086	134	2 *	VVTP	Variable value table start
0088	136	2 *	STMTAB	Statement table
008A	138	2 *	STMCUR	Current statement pointer
008C	140	2 *	STARP	String and array area
008E	142	2 *	RUNSTK	BASIC's software stack
0090	144	2 *	MEMTOP	Top of memory used by BASIC program
00BA	186	2	STOPLN	Line number of most recent stop or error
00C3	195	1	ERRSAV	Error number causing TRAP branch
00CB	203	7		Available for user machine-language programs
00D0	212	2		Value return from machine language to BASIC

* Indicates location is a vector

ANTIC Commands (Display List)

Blank line commands:

Command is $(\# \text{ lines} + 1) * 16$

Ex.: Blank 8 lines is $(8 + 1) * 16$, or $\$70 = \text{dec. } 144$

Jump instruction: $\$01 = \text{dec. } 1$ (2-byte instruction)

Jump on vertical blank = $\$41 = \text{dec. } 65$ (2-byte instruction)

Display line instruction is equal to the IR mode number ($\$02-\$0F$).

To set special features, add these values to the instructions:

Add

Hex	Dec	For
10	16	Horizontal scroll enable
20	32	Vertical scroll enable
40	64	Load memory scan (makes it a 2-byte instruction)
80	128	Display list interrupt enable

Note: Display list interrupt can be enabled on any command, but scrolling and load memory scan can be enabled only on display commands.

ANTIC Commands (Display Modes)

Mode	IR	BASIC	Horiz. Pixels	Scan Lines	Colors	Char/Map Mode
				Per Mode Line		
02		0	40	8	1.5	C
03			40	10	1.5	C
04			40	8	5	C
05			40	16	5	C
06	1		20	8	5	C
07	2		20	16	5	C
08	3		40	8	4	M
09	4		80	4	2	M
0A	5		80	4	4	M
0B	6		160	2	2	M
0C			160	1	2	M
0D	7		160	2	4	M
0E			160	1	4	M
0F	8		320	1	1.5	M

GTIA:

The GTIA modes are versions of mode 8, instituted by adding 64, 128, or 192 to PRIOR.

Commodore Feature

- **SuperPET's Waterloo ASCII Character Set** — A description of the ASCII character set used in the Waterloo interpreters supplied with the SuperPET.
- **BASIC Squeeze** — A routine to squeeze out imbedded blanks, line separators, and comments for a BASIC program.
- **Microcomputers in the Chemical Engineering Curriculum, Part 2** — Analog transducers in a digital world.
- **Add a BASIC Line Delete Command** — A BASIC line delete command allows the user to delete blocks of BASIC program lines at the touch of a single key. The article shows how to implement this command, in machine language, on Commodore computers, including the VIC-20.
- **SOUP** — An efficient compare program for machine-language program files on Commodore disk. Uses BASIC 4.0 disk commands, but is otherwise compatible with other Microsoft BASICs.

- **It's All Relative — CBM Disk Techniques, Part 1** — An explanation of how to get the most from CBM's powerful disk operating system. Examples are drawn from a well-written mailing list package.
- **VIC Jitter Fixer** — Add this routine to your programs to help get reliable readings from your VIC paddle, joystick, and light pen registers.

Turn your Apple into the world's most versatile personal computer.

The SoftCard™ Solution. SoftCard turns your Apple into two computers. A Z-80 and a 6502. By adding a Z-80 microprocessor and CP/M to your Apple, SoftCard turns your Apple into a CP/M based machine. That means you can access the single largest body of microcomputer software in existence. Two computers in one. And, the advantages of both.

Plug and go. The SoftCard system starts with a Z-80 based circuit card. Just plug it into any slot (except 0) of your Apple. No modifications required. SoftCard supports most of your Apple peripherals, and, in 6502-mode, your Apple is still your Apple.

CP/M for your Apple. You get CP/M on disk with the SoftCard package. It's a powerful and simple-to-use operating system. It supports more software than any other microcomputer operating system. And that's the key to the versatility of the SoftCard/Apple.

BASIC included. A powerful tool, BASIC-80 is included in the SoftCard package. Running under CP/M, ANSI Standard BASIC-80 is the most powerful microcomputer BASIC available. It includes extensive disk I/O statements, error trapping, integer variables, 16-digit precision, extensive EDIT commands and string functions, high and low-res Apple graphics, PRINT USING, CHAIN and COMMON, plus many additional commands. And, it's a BASIC you can compile with Microsoft's BASIC Compiler.

More languages. With SoftCard and CP/M, you can add Microsoft's ANSI Standard COBOL, and FORTRAN, or

Basic Compiler and Assembly Language Development System. All, more powerful tools for your Apple.

Seeing is believing. See the SoftCard in operation at your Microsoft or Apple dealer. We think you'll agree that the SoftCard turns your Apple into the world's most versatile personal computer.

Complete information? It's at your dealer's now. Or, we'll send it to you and include a dealer list. Write us. Call us.

SoftCard is a trademark of Microsoft. Apple II and Apple II Plus are registered trademarks of Apple Computer. Z-80 is a registered trademark of Zilog, Inc. CP/M is a registered trademark of Digital Research, Inc.

THE PROWRITER COMETH.

(And It Cometh On Like Gangbusters.)

Evolution.

It's inevitable. An eternal verity.

Just when you think you've got it knocked, and you're resting on your laurels, somebody comes along and makes a dinosaur out of you.

Witness what happened to the Centronics printer when the Epson MX-80 came along in 1981.

And now, witness what's happening to the MX-80 as the ProWriter cometh to be the foremost printer of the decade.

SPEED

MX-80: 80 cps, for 46 full lines per minute throughput.

PROWRITER: 120 cps, for 63 full lines per minute throughput.

GRAPHICS

MX-80: Block graphics standard, fine for things like bar graphs.

PROWRITER: High-resolution graphics features, fine for bar graphs, smooth curves, thin lines, intricate details, etc.

PRINTING

MX-80: Dot matrix business quality.

PROWRITER: Dot matrix correspondence quality, with incremental printing capability standard.

FEED

MX-80: Tractor feed standard; optional friction-feed kit for about \$75 extra.

PROWRITER: Both tractor and friction feed standard.

INTERFACE

MX-80: Parallel interface standard; optional serial interface for about \$75 extra.

PROWRITER: Parallel and serial interface standard.

WARRANTY

MX-80: 90 days, from Epson.

PROWRITER: One full year, from Leading Edge.

PRICE

Heh, heh.
